IV-C

HIV Antibodies Tables

All HIV MAbs and polyclonal Abs that bind to linear epitopes 30 amino acids or less in length are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location, then by antibody type, and finally by antibody name. Abs that bind to conformational epitopes or with unknown epitopes are listed at the end of each protein section.

IV-C-1 Gag p17 Antibodies

No. 1
MAb ID L14.17
HXB2 Location p17 (11–25)
Author Location p17 (11–25 BRU)
Epitope `GELDRWEKIRLRPGG`
Neutralizing no
Immunogen vaccine
Vector/Type: viral lysate *Strain:* B clade BRU *HIV component:* HIV-1
Species (Isotype) mouse (IgG)
References Kanduc *et al.* 2008; Robert-Hebmann *et al.* 1992a; Robert-Hebmann *et al.* 1992b; Tatsumi *et al.* 1990

- L14.17: Similarity level of the L14.17 binding site pentapeptide WEKIR to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 1 time, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]

No. 2
MAb ID polyclonal
HXB2 Location p17 (11–25)
Author Location p17 (11–25 LAI)
Epitope `GELDRWEKIRLRPGG`
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein, virus-like particle (VLP) *Strain:* B clade LAI *HIV component:* Gag, p17 Gag, p24 Gag *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (Isotype) mouse
References Truong *et al.* 1997

- An ELISA assay was used to study a panel of Gag peptides – mature p24 CA epitopes mapped to residues 176-192, 201-218, 233-253, 285-304, and were recognized by antibodies elicited by rp24CA – one p17MA epitope, residues 11-25, and one p24CA epitope, residues 176-192, were recognized by antibodies raised against anti-p55 virus-like particles, suggesting a differentantigenic properties for p24CA and p17MA antibodies depending on whether they are produced against the mature soluble protein or the immature assembled form of the gag proteins. Truong *et al.* [1997]

No. 3
MAb ID 32/5.8.42
HXB2 Location p17 (12–19)
Author Location p17 (12–19 IIIB)
Epitope `ELDRWEKI+ALDKIE`
Neutralizing no
Immunogen vaccine
Vector/Type: viral lysate
Species (Isotype) mouse (IgG)
References Papsidero *et al.* 1989

- 32/5.8.42: Binds to two discontinuous regions, positions 12-19 and 100-105, peptides ELDRWEKI and ALDKIE – inhibited infectivity of cell free virus. Papsidero *et al.* [1989]

No. 4
MAb ID 32/5.8.42
HXB2 Location p17 (12–19)
Author Location p17 (IIIB)
Epitope `ELDRWEKI+ALDKIE`
Neutralizing no
Immunogen vaccine
Vector/Type: viral lysate *HIV component:* HIV-1
Species (Isotype) mouse (IgG)
References Papsidero *et al.* 1989

- 32/5.8.42: Inhibited infectivity of cell free virus – bound to two peptides, ELDRWEKI and ALDKIE, at positions 12-19 + 100-105. Papsidero *et al.* [1989]

No. 5
MAb ID HyHIV-1
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope `ELDKWEKIRLRPGGKTLY`
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG1)
References Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-1: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 6
MAb ID HyHIV-2
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope ELDKWEKIRLRPGGKTLY
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG1)
References Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-2: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 7
MAb ID HyHIV-3
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope ELDKWEKIRLRPGGKTLY
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG1)
References Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-3: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 8
MAb ID HyHIV-4
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope ELDKWEKIRLRPGGKTLY?
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG1)
References Ota & Ueda 1998; Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-4: epitope uncertain, based on the best estimate from JMH1 sequence– Ka is 1.8 x 10^7 M-1 for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface. Ota *et al.* [1998]
- HyHIV-4: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 9
MAb ID HyHIV-5
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope ELDKWEKIRLRPGGKTLY
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG1)
References Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-5: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 10
MAb ID HyHIV-6
HXB2 Location p17 (12–29)
Author Location p17 (12–29 JMH1)
Epitope ELDKWEKIRLRPGGKTLY
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG1)
References Ota & Ueda 1998; Liu *et al.* 1995

- HyHIV-6: This paper compares the results of affinity constant (Ka) measurements of anti-p17 MAbs using double Ab methods versus the faster, isotope-free BIAcore system, and results were found to be similar for HyHIV-(1-6) – six MAbs all bind to the first alpha helix of p17, a functional domain for both membrane binding and nuclear localization. Ota & Ueda [1998]

No. 11
MAb ID 32/1.24.89
HXB2 Location p17 (17–22)
Author Location p17 (17–22 IIIB)
Epitope EKIRLR
Neutralizing L
Immunogen vaccine
Vector/Type: viral lysate
Species (Isotype) mouse (IgG)
References Papsidero *et al.* 1989

- 32/1.24.89: Inhibited infectivity of cell free virus. Papsidero *et al.* [1989]

No. 12

B Cell

MAb ID 3B10
HXB2 Location p17 (19–38)
Author Location p17 (19–38 SIVmac)
Epitope IRLPGGKKKYMLKHVVWAA
Neutralizing no
Immunogen vaccine
Vector/Type: inactivated HIV *Strain:* B clade AGM TYO-7 *HIV component:* HIV-1
Species (Isotype) mouse (IgG1)
References Otteken *et al.* 1992

- 3B10: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H) , SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one conserved immunogenic epitope recognized serologically. Otteken *et al.* [1992]

No. 13
MAb ID 3E11
HXB2 Location p17 (19–38)
Author Location p17 (19–38 SIVmac)
Epitope IRLPGGKKKYMLKHVVWAA
Neutralizing no
Immunogen vaccine
Vector/Type: inactivated HIV *Strain:* B clade AGM TYO-7 *HIV component:* HIV-1
Species (Isotype) mouse (IgG1)
References Nilsen *et al.* 1996; Otteken *et al.* 1992

- 3E11: There is another MAb with this ID that recognizes integrase. Nilsen *et al.* [1996]
- 3E11: Recognized an epitope present on HIV-2/SIVmac (MAC251/32H), SIVagm, HIV-1, and SIVmnd, demonstrating that the matrix protein of all nine HIV and SIV isolates tested in this study expresses at least one highly conserved immunogenic epitope. Otteken *et al.* [1992]

No. 14
MAb ID polyclonal
HXB2 Location p17 (25–34)
Author Location Gag
Epitope GKTHYMINPL
Neutralizing
Immunogen vaccine
Vector/Type: peptide *HIV component:* Env, Gag, Nef, Pol
Species (Isotype) rabbit
References Li *et al.* 2005b
Keywords mimics

- In early HIV-1 infection, patients develop autoimmune thrombocytopenia, with Ab directed against beta3 integrin, GPIIIa49-66. Panning with a 7-mer phage display library using rabbit anti-GPIIIa49-66 (CAPESIEFPVSEARVLED), the immunodominant epitope of the identified potential molecular mimicry epitopes with HIV-1 Env (sklFDeGLFn, elfnkTIIFP), Pol (geAPEFPskq), Gag (gktHyMINPl) and Nef (qeeeeVgFPVt, qeeeeVgFPVt, edeGigFPVr, fkLVPVSEae, ssnTPTTNaa) proteins. Pools of these peptides elicted Ab in rabbits that induce platelet oxidation in vitro and thrombocytopenia in vivo upon passive transfer. Nef (qeeeeVgFPVt), Gag (gktHyMINPl), and Nef (fkLVPVSEae) all overlap with known HIV-1 epitopes. Li *et al.* [2005b] (**mimics**)

No. 15
MAb ID 8H10
HXB2 Location p17 (30–52)
Author Location p17 (30–52 JMH1)
Epitope KLKHIVWASRELERFAVNPGLLE
Neutralizing
Immunogen vaccine
Vector/Type: peptide *Strain:* B clade JMH-1 *HIV component:* p17 Gag *Adjuvant:* BSA
Species (Isotype) mouse (IgM)
References Ota & Ueda 1999; Ota *et al.* 1999

- 8H10: The p17 MAb also can bind to the V3 loop. Ota *et al.* [1999]
- 8H10: Inhibits viral replication of the HIV-1 infected MT-4 cells by decreasing p17 DNA levels in the infected cells, and the effect of growing the 8H10 hybridoma in co-culture with HIV-1 infected MT-4 cells was studied. Ota & Ueda [1999]

No. 16
MAb ID HyHIV-21
HXB2 Location p17 (30–52)
Author Location p17 (30–52 JMH1)
Epitope KLKHIIWASRELERFAVNPGLLE
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* p17 Gag
Species (Isotype) mouse (IgG2a)
References Ota *et al.* 1998; Liu *et al.* 1995

- HyHIV-21: epitope uncertain, based on the best estimate from JMH1 sequence – Ka is 3.6 x 10^6 M-1 for rec p17 – stains the surface of infected cells indicating the antigen is exposed at the cell surface –inhibited growth of HIV-1 JMH1 in MT-4 cells when added 24 hours after the initial culture. Ota *et al.* [1998]

No. 17
MAb ID B4f8
HXB2 Location p17 (51–65)
Author Location p17 (51–65)
Epitope LETSEGCRQILGQLQ
Neutralizing no
Immunogen vaccine
Vector/Type: HIV infected-cell lysate *Strain:* B clade IIIB *HIV component:* HIV-1
Species (Isotype) rat (IgG2a)
References Shang *et al.* 1991

Epitope LKETINEEAAEWDRVHPV
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein, virus-like particle (VLP) *Strain:* B clade LAI *HIV component:* Gag, p17 Gag, p24 Gag *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (Isotype) mouse
References Truong *et al.* 1997

- An ELISA assay was used to study a panel of Gag peptides – mature p24 CA epitopes mapped to residues 176-192, 201-218, 233-253, 285-304, and were recognized by antibodies elicited by rp24CA – one p17MA epitope, residues 11-25, and one p24CA epitope, residues 176-192, were recognized by antibodies raised against anti-p55 virus-like particles, suggesting a different antigenic properties for p24CA and p17MA antibodies depending on whether they are produced against the mature soluble protein or the immature assembled form of the gag proteins. Truong *et al.* [1997]

- p5F1: MAb p5F1 was derived from hybridoma from mice immunized with HIV-1 p24. p5F1 reacted with p24 from HIV-1 IIIB, Ada-M, 74V, and KM018 strains. p5F1 recognized peptide DC-22, Gag 329-350. Detection limit for rp24 in a modified sandwich ELISA of p5F1 was about 15 ng/ml, while p5F1 could detect as low as 40 pg/ml of p24 in standard ELISA. p5F1 showed good specificity and high sensitivity in a modified sandwich ELISA with rabbit anti-p24 serum, indicating its potential use for measurement of p24 antigen levels in research. Liu *et al.* [2007] (**antibody generation**, **binding affinity**, **assay standardization/improvement**)

Keywords assay development

- Sheep polyclonal and mouse monoclonal Abs raised against highly conserved HIV-1 p24 Gag peptides were used in a nanoparticle-based bio-barcode-amplification method. As in the conventional ELISA, the detection specificity of the bio-barcode-amplification method, tested on 112 plasma samples from HIV-1 infected subjects, was 100%. The sensitivity of the bio-barcode-amplification method was 99% compared to 20.5% of the conventional ELISA. p24 Gag was also detected in 60 diverse viruses tested, including ten from each of the most prevalent HIV-1 clades: A, B, C, D, CRF01_AE, and CRF02_AG. Like the quantitative real-time PCR assay, the bio-barcode-amplification method was highly sensitive, although it was not quantitative when low levels of virus were present. HXB2 Location Gag
Author Location p24
Epitope
Neutralizing no
Immunogen vaccine
Vector/Type: DNA with CMV promotor, DNA with CMV/MCK hybrid promotor, DNA with MCK promotor
Species (Isotype)
References Bojak *et al.* 2002a

B Cell

- 16/4/2: The ability of three different promoters to induce Gag specific immune responses was compared. The cytomegaliovirus (CMV) early gene promoter, which allows constitutive expression in different cells of host tissue, the tissue specific muscle creatine kinase (MCK) promoter, which may be restricted to differentiated, multinucleated myofibers and so safer, and a hybrid MCK/CMV promoter – intramuscular immunization of BALB/c mice utilizing the MCK promoter in combination with a codon optimized gag gene generated humoral (IgG1 (Th1) and IgG2a (Th2)) and CTL immune responses against HIV-1 Gag, however, the quantified immune parameters were clearly reduced as compared to CMV promotor-driven Gag expression. Bojak *et al.* [2002a]

Species (Isotype) mouse
References Deml *et al.* 2001

- Immunization mice with a codon-optimized Gag was compared with a non-optimized Rev dependent Gag expression vector – Gag expression was at higher levels and Rev independent with the codon-optimized Gag, and i.m. immunization gave a stronger Th1-driven humoral and cellular immune response – intradermal immunization with either Gag DNA induced a Th2 response and no CTL. References Montefiori *et al.* 2001

- In 7/9 patients in whom HAART was initiated during early seroconversion, NAbs to autologous strains were not found immediately following treatment interuption after 1-3 years, and Env and Gag Abs were low or undetected by ELISA indicating, that early HAART suppresses the normal antibody response to HIV-1, presumably by limiting the concentration of viral antigens needed to drive B-cell maturation – in 3 patients with a viral rebound autologous NAbs rapidly appeared and correlated with spontaneous down-regulation of viremia – prolonged control of viremia after stopping treatment persisted in the absence of detectable NAbs, suggesting that cellular immune responses alone can control viremia under certain circumstances – these results support the notion that virus-specific B-cell priming, combined with CD8+ CTL induction, may be beneficial for HIV-1 vaccines that aim to suppress viremia in the absence of complete protection to prevent disease and reduce the rate of virus transmission. Vector/Type: DNA with CMV promotor, DNA with CMV/MCK hybrid promotor, DNA with MCK promotor
Species (Isotype) mouse (IgG1, IgG2a)
References Bojak *et al.* 2002a

- The ability of three different promoters to induce Gag specific immune responses was compared. The cytomegaliovirus (CMV) early gene promoter, which allows constitutive expression in different cells of host tissue, the tissue specific muscle creatine kinase (MCK) promoter, which may be restricted to differentiated, multinucleated myofibers and so safer, and a hybrid MCK/CMV promoter – intramuscular immunization of BALB/c mice utilizing the MCK promoter in combination with a codon optimized gag gene generated humoral (IgG1 (Th1) and IgG2a (Th2)) and CTL immune responses against HIV-1 Gag, however, the quantified immune parameters were clearly reduced as compared to CMV promotor-driven Gag expression. Keywords acute/early infection, assay development

- A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLLGIWGCSGKICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. This assay can be used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development**, **acute/early infection**)

- DNA encoding Gag as a chimera with the mouse and human lysosome-associated membrane protein (mLAMP/gag and hLAMP/gag) was used in immunization studies in mice and macaques. IgG responses in mice immunized with hLAMP/gag were considerably greater than the response to the mLAMP/gag. Strong HIV-specific IgG response was also observed in hLAMP/gag immunized macaques, which increased after each DNA immunization. Significant Gag-specific IgA levels were detected in 3 of 5 immunized macaques. Serum samples from the macaques recognized 13 of 49 20-aa Gag peptides covering Gag sequence indicating broad B-cell response. Chikhlikar *et al.* [2006] (**vaccine antigen design**)

Immunogen vaccine
Vector/Type: protein *HIV component:* RT
Species (Isotype) mouse (IgG1)
References Orvell *et al.* 1991

No. 208
MAb ID polyclonal
HXB2 Location RT (521–531)
Author Location RT (521–531 PV22)
Epitope `IIEQLIKKEKV`
Neutralizing no
Immunogen HIV-1 infection
Species (Isotype) human (IgG)
References Grimison & Laurence 1995

No. 209
MAb ID C2003
HXB2 Location RT (536–549)
Author Location RT (703–716 BH10)
Epitope `VPAHKGIGGNEQVD`
Neutralizing no
Immunogen vaccine
Vector/Type: peptide *Strain:* B clade BH10
Species (Isotype) rabbit (IgG)
References DeVico *et al.* 1991

- C2003: Inhibits polymerase activity from a variety of retroviruses – RT protected from inhibition by preincubation with template primer. DeVico *et al.* [1991]

No. 210
MAb ID anti-RT
HXB2 Location RT

Author Location RT
Epitope
Neutralizing
Immunogen in vitro stimulation or selection
Species (Isotype) (IgA)
References Wright *et al.* 2006
Keywords neutralization

- anti-RT: Intracellular neutralization of HIV by anti-RT IgA MAbs against internal viral proteins was observed in this study. Wright *et al.* [2006] (**neutralization**)

IV-C-9 Integrase Antibodies

No. 211
MAb ID 1C4
HXB2 Location Integrase (1–16)
Author Location Integrase (1–16 HXB2)
Epitope FLDGIDKAQDEHEKYH
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Nilsen *et al.* 1996; Haugan *et al.* 1995

- 1C4: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]
- 1C4: MAb interferes with integrase binding to DNA. Haugan *et al.* [1995]

No. 212
MAb ID 2C11
HXB2 Location Integrase (1–16)
Author Location Integrase (1–16 HXB2)
Epitope FLDGIDKAQDEHEKYH
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Nilsen *et al.* 1996

- 2C11: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]

No. 213
MAb ID 2E3
HXB2 Location Integrase (1–16)
Author Location Integrase (1–16 HXB2)
Epitope FLDGIDKAQDEHEKYH
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Ovod *et al.* 1992; Nilsen *et al.* 1996

- 2E3: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]
- 2E3: There are two MAbs called 2E3 – the other one binds to Nef. Ovod *et al.* [1992]

No. 214
MAb ID 3E11
HXB2 Location Integrase (1–16)
Author Location Integrase (1–16 HXB2)
Epitope FLDGIDKAQDEHEKYH
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Nilsen *et al.* 1996; Otteken *et al.* 1992

- 3E11: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]
- 3E11: There is another MAb with this ID that recognizes p17. Otteken *et al.* [1992]
- 3E11: Recognized an epitope present on HIV-2/SIVmac, SIVagm, HIV-1, and SIVmnd. Otteken *et al.* [1992]

No. 215
MAb ID 3F9
HXB2 Location Integrase (1–16)
Author Location Integrase (1–16 HXB2)
Epitope FLDGIDKAQDEHEKYH
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Nilsen *et al.* 1996

- 3F9: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]

No. 216
MAb ID 5F8

Epitope `FLDGIDKAQDEHEKYH`
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Nilsen *et al.* 1996

- 7C6: One of a large set of MAbs that interact with the N-terminal part of integrase: 1C4, 2C11, 2E3, 3E11, 3F9, 5F8, 6G5, 7B6, 7C6 – these MAbs inhibit end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]

No. 220
MAb ID 6C5
HXB2 Location Integrase (17–38)
Author Location Integrase (17–38 HXB2)
Epitope `SNWRAMASDFNLPPVVAKEIVA`
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Nilsen *et al.* 1996; Haugan *et al.* 1995

- 6C5: This MAb inhibits end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]
- 6C5: MAb interferes with integrase binding to DNA. Haugan *et al.* [1995]

No. 221
MAb ID 8G4
HXB2 Location Integrase (22–31)
Author Location Integrase (12–42 HXB2)
Epitope `MASDFNLPPV+GYIEAEVIPAETGQETAYFI?`
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2
HIV component: Int
Species (Isotype) mouse (IgG1κ)
References Nilsen *et al.* 1996; Haugan *et al.* 1995

- 8G4: This MAb reacted strongly with peptides IN(12-31) and IN(22-42), and less strongly with peptide IN(82-101) – it did not react with a deletion mutant of positions 17-38 – this MAb inhibits end processing and DNA joining, but had little effect on integration activities. Nilsen *et al.* [1996]
- 8G4: MAb interferes with integrase binding to DNA. Haugan *et al.* [1995]

No. 222
MAb ID 17 (mAb17)
HXB2 Location Integrase (25–35)
Author Location Integrase (25–35)
Epitope `DFNLPPVVAKE`
Neutralizing no

B Cell

Immunogen vaccine
Vector/Type: protein *HIV component:* Int
Species (Isotype) mouse (IgG1)
References Yi *et al.* 2000; Levy-Mintz *et al.* 1996; Bizub-Bender *et al.* 1994

- 17: Epitope mapped to helix-turn-helix motif in the N-term domain of Integrase, positions 25-35 – Zn binding stabilizes the Integrase-mAb17 complex – both MAb and Fab form of mAb17 inhibit Integrase activity – epitope region likely to be involved in protein-protein interaction. Yi *et al.* [2000]
- 17: Used for the creation of single chain variable antibody fragments (SFvs) for internal cellular expression – neutralization of IN activity prior to integration, whether the Ab is expressed in the nucleolus or the cytoplasm – relative binding affinity to IN: 12 > 17 = 33 > 21 > 4. Levy-Mintz *et al.* [1996]
- 17: BALBc mice were immunized with rec integrase, hybridomas expressing anti-integrase Abs were generated, and the antibodies characterized – the Zn finger motif is in the binding region – MAbs 14 and 17 form a competition group. Bizub-Bender *et al.* [1994]

No. 223
MAb ID 4D6
HXB2 Location Integrase (42–55)
Author Location Integrase (42–55 HXB2)
Epitope KCQLKGEAMHGQVD
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2 *HIV component:* Int
Species (Isotype) mouse (IgG1κ)
Ab Type N-term
References Kanduc *et al.* 2008; Nilsen *et al.* 1996; Haugan *et al.* 1995

- 4D6: Similarity level of the 4D6 binding site pentapeptide AMHGQ to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 0 times, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 4D6: This MAb inhibits end processing and DNA joining, and reduces reintegration activity. Nilsen *et al.* [1996]
- 4D6: MAb interferes with integrase binding to DNA. Haugan *et al.* [1995]

No. 224
MAb ID 7-16 (7-19)
HXB2 Location Integrase (50–159)
Author Location Integrase (50–159 HXB2)
Epitope
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: chimeric maltose binding protein (MBP) *Strain:* B clade IIIB *HIV component:* Int
Species (Isotype) mouse (IgG2b)
Ab Type Integrase catalytic core
Research Contact Yoshihiro Kitamura, Div of Mol Genetics, Nat Inst of Infectious Diseases, Musashimurayama, Japan
References Ishikawa *et al.* 1999

- 7-16: Binds to the central catalytic domain – the paper seems to sometimes call this antibody 7-16, sometimes 7-19, a possible typo. Ishikawa *et al.* [1999]

No. 225
MAb ID 4F6
HXB2 Location Integrase (56–102)
Author Location Integrase (56–102 HXB2)
Epitope CSPGIWQLDCTHLEGKVILVAVHVASGYIEAE-VIPAETGQETAYFLL
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2 *HIV component:* Int
Species (Isotype) mouse (IgG1κ)
Ab Type Integrase catalytic core
References Nilsen *et al.* 1996; Haugan *et al.* 1995

- 4F6: MAb binding had minimal effects on IN *in vitro* activities. Nilsen *et al.* [1996]
- 4F6: MAb interferes with integrase binding to DNA. Haugan *et al.* [1995]

No. 226
MAb ID anti-K159
HXB2 Location Integrase (151–163)
Author Location Integrase (163–175)
Epitope VESMNKELKKIIG
Neutralizing
Immunogen vaccine
Vector/Type: peptide *HIV component:* Int
Species (Isotype) rabbit (IgG)
References Maksiutov *et al.* 2002; Maroun *et al.* 1999

- anti-K159: This epitope is similar to a fragment of the human protein Apoptosis regulator BCL-W (KIAA0271), ESVNKEMEPLVGQV. Maksiutov *et al.* [2002]
- anti-K159: Both the peptide K159, SQGVVESMNKELKKIIGQVRDQAEHLKTA, and the Abs raised against this peptide inhibit Integrase activity – K159 was found to fulfill condition of minimal number of helical heptads to achieve the formation of a stable coiled-coil structure – Integrase is proposed to function as a dimer interacting in this region. Maroun *et al.* [1999]

No. 227
MAb ID 5D9
HXB2 Location Integrase (186–250)
Author Location Integrase (186–250 HXB2)
Epitope
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *Strain:* B clade HXB2 *HIV component:* Int
Species (Isotype) mouse (IgG1κ)
Ab Type Integrase DNA binding domain

References Nilsen *et al.* 1996; Haugan *et al.* 1995

- 5D9: MAb binding had minimal effects on IN *in vitro* activities. Nilsen *et al.* [1996]
- 5D9: While C-term and N-term anti-Integrase MAbs interfere with Integrase-DNA binding, 5D9 which binds more centrally, does not. Haugan *et al.* [1995]

No. 228
MAb ID 8-6
HXB2 Location Integrase (211–227)
Author Location Integrase (211–227 HXB2)
Epitope `KELQKQITKIQNFRVYY`
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: chimeric maltose binding protein (MBP) *Strain:* B clade IIIB *HIV component:* Int
Species (Isotype) mouse (IgG1)
Research Contact Yoshihiro Kitamura, Div of Mol Genetics, Nat Inst of Infectious Diseases, Musashimurayama, Japan
References Kanduc *et al.* 2008; Ishikawa *et al.* 1999

- 8-6: Similarity level of the 8-6 binding site pentapeptide ITKIQ to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 0 times, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 8-6: Antibody binds proximal to the DNA binding region. Ishikawa *et al.* [1999]

No. 229
MAb ID 19 (2-19, scAb2-19)
HXB2 Location Integrase (228–236)
Author Location Integrase (228–236 LAI)
Epitope `RDSRNPLWK`
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* Int
Species (Isotype) mouse (IgG1)
References Kanduc *et al.* 2008; Kitamura *et al.* 1999; Levy-Mintz *et al.* 1996; Bizub-Bender *et al.* 1994

- 19: Similarity level of the 19 binding site pentapeptide RNPLW to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 0 times, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 19: Called 2-19, scAb2-19 is a single-chain Ab made from MAb 2-19 –acts intra-cellularly to block infection at low MOI by binding to integrase – scAb interfered with the folding of Gag-Pol polyprotein, the Ab did not affect viral production in LAI transfected cells, but the virus produced was less infectious – authors suggest that the epitope may be conformational. Kitamura *et al.* [1999]
- 19: BALBc mice were immunized with rec integrase, hybridomas expressing anti-integrase Abs were generated, and the antibodies characterized – 19 has a low binding affinity. Bizub-Bender *et al.* [1994]

No. 230
MAb ID 2-19
HXB2 Location Integrase (228–236)
Author Location Integrase (228–236 HXB2)

Ab Type gp120 V3
References Barin *et al.* 2005
Keywords acute/early infection, assay development
- A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLLGIWGC-SGKICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. Integrase antibodies are among the last to appear after infection. This assay can be used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development**, **acute/early infection**)

Species (Isotype) mouse (IgG2b)
Ab Type C-term
References Schreiber *et al.* 2005; Yi *et al.* 2002; Yi & Skalka 2000; Levy-Mintz *et al.* 1996; Bizub-Bender *et al.* 1994
Keywords antibody binding site definition and exposure, computational epitope prediction, mimotopes, structure

- 33: Called Fab33. A new computer program designed to recognize conformational epitopes in 3D structures that correspond to linear peptide mimotopes (3DEX) was tested using the known conformational epitope of this Fab. 223F, 224R, 226Y, 244K, 267I, and 268I, previously defined as the epitope from NMR structural studies (Yi2002) were confirmed, along with two additional amino acids, (A265 and K266). Schreiber *et al.* [2005] (**antibody binding site definition and exposure**, **mimotopes**, **computational epitope prediction**, **structure**)
- 33: Called mAb33 – mAb33 and mAb32 compete for binding to the C-term domain of Integrase – while mAb32 only weakly inhibits IN activity, mAb33 inhibits strongly, mAb32 has a lower affinity than mAb33, and Fab32 does not inhibit at all while Fab33 inhibits catalytic activity and DNA binding – heteronuclear NMR indicated eight residues of Integrase are immobilized upon Fab33 binding, two in the core of the protein, and 6 on the outer face that form a contiguous patch likely to contain the epitope – 223F, 224R, 226Y, 244K, 267I, and 268I, which may be a useful target for drug design – the Fab33-IN complex is far more soluble than IN alone and may be useful for crystallization. Yi *et al.* [2002] (**antibody binding site definition and exposure**)
- 33: Limited proteolysis combined with mass spectrometric analysis were used to define the binding site for Fab32, but Fab33 binding to the Intergrase C-term domain left it resistant to proteolytic digestion. Yi & Skalka [2000]
- 33: Used for the creation of single chain variable antibody fragments (SFvs) for internal cellular expression – neutralization of IN activity prior to integration, whether the Ab is expressed in the nucleolus or the cytoplasm – relative binding affinity to IN: 12 > 17 = 33 > 21 > 4. Levy-Mintz *et al.* [1996]
- 33: BALBc mice were immunized with rec integrase, hybridomas expressing anti-integrase Abs were generated, and the antibodies characterized – MAbs 32 and 33 form a competition group. Bizub-Bender *et al.* [1994]

Neutralizing
Immunogen HIV-1 infection
Species (Isotype) human (IgG)
References Richardson *et al.* 2003
Keywords rate of progression

- Serum samples were obtained from the French GRIV (genetic resistance to HIV) cohort and tested for anti-Tat and anti-Vpr responses, as both may contribute as extracellular proteins to pathogenesis. Serum anti-Vpr IgG responses were significantly higher in stable non-progressors (CD4+ T cell counts greater than 500 cell/ul after being positive for 8 years with no ART) and unstable non-progressors (declined during a 20 month follow up), than fast progressors (CD4+ T less than 300 cells/ul within 2 years of seroconversion, some HAART). Serum anti-Tat IgG was found to be significantly higher in stable non-progressors compared to unstable non-progressors and fast progressors indicating that higher levels of serum anti-Tat IgG are associated with maintenance of non-progression status. Richardson *et al.* [2003] (**rate of progression**)

Immunogen vaccine
Vector/Type: protein *Strain:* B clade IIIB *HIV component:* Tat *Adjuvant:* Incomplete Freund's Adjuvant (IFA), macrophage activating lipopeptide-2 (MALP-2)
Species (Isotype) mouse (IgA, IgG)
References Borsutzky *et al.* 2003
Keywords adjuvant comparison, genital and mucosal immunity, immunodominance, mucosal immunity, Th1, Th2, vaccine-induced epitopes

- Intranasal immunization of BALB/c mice Tat with MALP-2 induced stronger immune responses than i.p. vaccination of Tat with IFA. Also i.n. MALP-2 vaccination favored Th1 responses, while i.p IFA favored Th2. Ab, T help and CTL responses were observed. MALP-2 enhanced Tat-specific IgA responses in the lung and in the genital tract. Three linear Ab epitopes were recognized. The most frequent response (80% of vaginal lavage, 100% of sera and lung lavage) was to Tat peptide 1-20. The second strongest to Tat 46-60 (20% of vaginal lavage, 50% of lung lavage, 50% of sera). Finally, 50% of the sera of Tat+ IFA i.p. immunized mice recognized Tat 73-86. Borsutzky *et al.* [2003] (**adjuvant comparison**, **genital and mucosal immunity**, **vaccine-induced epitopes**, **immunodominance**, **mucosal immunity**, **Th1**, **Th2**)

- TA9: Similarity level of the TA9 binding site pentapeptide MEPVD to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 1 time, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- This is one of 5 anti-Tat murine monoclonal antibodies generated in this study. TA9 is clade B specific, and does not recognize Tat from clade A, C, D, or CRF01 (AE).TA9 binds to the Tat peptide aa 1-61 strongly, and is also able to bind to Tat aa 1-20, and Tat peptide aa 8-53. - Intramuscular injection of Tat-toxoid induced high titers of anti-Tat reactivity in serum samples of six HIV-1 positive and of four HIV negative study subjects. Anti-Tat antibodies successfully blocked extracellular Tat from transactivating HIV Tat-sensitive promotors. The anti-Tat IgG response in sera from two healthy and HIV infected patients inhibited cell entry of synthetic Tat, thus blocking its functional activity. Additionally, the anti-Tat antibodies inhibited intercellular Tat transfer as demonstrated by a co-culture cell system. All HIV-1 infected patients had Ab responses to the N-term region of Tat, and 4/4 HIV-1 + and 5/6 HIV-1 negative patients responded to the basic domain. Several additional peptides were recognized either exclusively or more commonly in the HIV+ people. The N-terminus region of Tat mediates binding to CD26, that may be involved in modulation of chemokine function, and may also mediate T-cell apotosis. - Tat1: This natural Ab was cloned an characterized from an HIV-1 seronegative patient. It was a polyreactive Ab of IgG1 isotype. The clone showed a pattern of mutations suggesting antigen-driven mechanisms of selection. Its heavy chain was derived from a V-gene subfamily highly represented in fetal life. Antibodies belonging to this class are also frequently described as autoantibodies. The heavy chain of the Ab exhibited an unusual and extremely long hydrophilic CDR3 and was mainly responsible for the Ab polyreactivity. - Sera from 20 HIV-1 positive individuals were tested for their ability to react with Tat proteins from different clades, and were found to react with subtype A, B, and D, but not with subtype C or CRF01 (AE). Sera from 101 slow progressors and 42 fast progressors were tested for responses to Tat peptides, and compared to responses to gp41 peptide, as anti-Tat antibodies have been shown by others to be elevated in slow progressors. In this study, overall levels of Tat antibodies were not different in the two groups, however relative levels of antibodies to different Tat and gp41 peptides were observed. Keywords adjuvant comparison, mucosal immunity

- Intranasal immunization of BALB/c mice with Tat and e.coli heat-labile enterotoxin (LT) and non-toxic LT-R72 LT induced strong antigen-specific IgG Abs which remained stable for one year. Tat-specific IgA reponses were measured in vaginal and intestinal secretions. Immunization of BALB/c mice with native Tat (aa1-86) induced serum IgG directed against an immunodominant epitope (aa1-20) and against a second epitope (aa 46-60). CTL responses were also observed. Anti-Tat serum Abs neutralized Tat activity in a dose-independent manner. C57BL/6 remained unresponsive to Tat immunizations when Tat was co-adminstered with LT or cholera toxin (CT) as adjuvant; BALB/c mice are H-2d, C57BL/6 are H-2b. Congenic BALB.C mice that express H-2b rather than H-2d also could not respond to Tat, suggesting the repsonse to Tat is constrained by the haplotype. References Voss *et al.* 2003
Keywords adjuvant comparison, variant cross-recognition or cross-neutralization

- Monkeys were immunized with different combinations of gp120/NefTat/SIV-Tat three times over a three-month time period and intravenously challenged with SHIV 89.6P four weeks after the last immunzation. Vaccination induced anti-Tat, -Nef and -gp120 Ab responses that decreased until challenge. Neutralizing Ab responses against HIV-1 MN and HIV-1 W61D were observed. Vaccination with the combination of all three proteins reduced viral load and kept animals from a CD4+ T cell decline, preventing AIDS for more than 2.5 years. The adjuvant AS02A elicited NAbs and protected from disease, while AS06 did not. gp120 alone or TatNef/SIV-Tat without gp120 could not protect from disease. - Immunization of mice with recombinant adenylate cyclase molecule carrying HIV-1 Tat (CyaA-E5-Tat) without adjuvant generated strong anti-Tat humoral responses that exhibited potent Tat neutralizing capacities. Sera from these mice were shown to recognize Tat peptides containing amino acids 1 to 20 and 46 to 65. The IgG1/IgG2a ratio observed in these sera was consistent with a Th1 polarization. In contrast, immunization of mice with Tat toxoid in presence or absence of alum adjuvant failed to induce responses comparable to those in CyaA-E5-Tat immunized animals. Sera from Tat toxoid immunized mice recognized Tat peptide containing amino acids 73 to 86 and showed prevalence of IgG1 indicating Th2 polarization. Insertion of Tat into CyaA did not modify the function of CyaA, the inserted Tat protein had no transactivating activity, and the complex was not toxic to bone-marrow derived dendritic cells. - Tat complexed with a low-molecular-weight heparin fragment (Hep6000) had altered cell-binding capacity and transactivating activity, and was less susceptible to proteolysis. Mice immunized with Tat-Hep6000 complex had an anti-Tat Ab response that was 10- and 100- fold higher than mice immunized with Tat alone or with a Tat toxoid, respectively. The Ab responses were predominantly of IgG1 isotype. Sera from mice immunized with Tat-Hep6000 neutralized the transactivating activity of Tat more efficiently than sera from mice immunized with Tat only. Both sera bound mainly to the N-terminal region of the protein, indicating that formation of the complex does not alter the B-cell immunodominant region. These results indicate that the immunogenic properties of Tat can be increased by a ligand-stabilizing strategy. Lecoq *et al.* [2008] (**neutralization**, **vaccine antigen design**)

- scFvtat1: Single chain anti-Tat Ab scFvtat1 was fused to the protein transduction domain (PTD) of Tat that mediates nuclear localization. It was shown that the PTD targets the scFvtat1 Ab directly to the site of Tat action inside the nucleus, where the PTD competes with Tat binding to TAR and the scFvtat1 simultaneously binds to Tat interfering with its interactions with cyclinT. The PTD-scFvtat1 fusion complex potentially inhibits Tat-mediated transactivation both when expressed inracellularly or when added as purified protein but that it does not inhibit HIV-1 Tat translocation to the nucleus, suggesting that Tat traffic can only marginally be affected by anti-Tat Abs. - Serum samples were obtained from the French GRIV (genetic resistance to HIV) cohort and tested for anti-Tat and anti-Vpr responses as both may contribute as extracellular proteins to pathogenesis. Serum anti-Tat IgG responses were significantly higher and maintained for up to 20 months in stable non-progressors (CD4+ T cell counts greater than 500 cell/ul after being positive for 8 years with no ART) compared to unstable non-progressors and fast progressors (CD4+ T less than 300 cells/ul within 2 years of seroconversion, some HAART). Anti-Tat IgG from GRIV stable non-progressors recognized linear epitopes located within the N-terminal, basic and the C-terminal domains of Tat. Humoral responses of fast-progressors and of one unstable non-progressor were restricted to the basic region of Tat. Tat toxoid vaccinees from Milan tended to recognize N-terminal and C-terminal domains. Sera from some GRIV and Tat toxoid vaccinees cross-reacted in an ELISA assay with a truncated 89.6 S/HIV 89.6P Tat, 89.6P Tat, HIv-1 subtype E (CMU08) and with SIVmac251 Tat (one sample). Keywords rate of progression

- 12 rabbits were immunized with different combinations of Tat peptides. Abs raised against peptide aa 8-53 did not react with the peptide 19-53, suggesting that the N-terminal region is important. Serum from these animals was able to inhibit Tat-induced apoptosis, and Tat antibodies in humans are associated with long term survival. Belliard *et al.* [2003] (**rate of progression**)

No. 333
MAb ID B1E3
HXB2 Location Tat
Author Location Tat (44–61)
Epitope
Subtype B
Neutralizing yes
Immunogen vaccine
Strain: B clade *HIV component:* Tat
Species (Isotype) human (IgG1κ)
Ab Type Tat basic region
References Moreau *et al.* 2004
Keywords antibody binding site definition and exposure, subtype comparisons

B Cell

• B1E3: B1E3 is a MAb derived from a Tat-toxoid vaccinated uninfected volunteer. B1E3 recognized two Tat peptides, aa19-53 and aa44-61 of an unspecified HIV-1 clade B Tat protein. B1E3 demonstrates a weak binding affinity to rTAT protein in solution, suggesting that epitope recognition may be conformation dependent B1E3 did not recognize synthetic HIV-1 clade B Tat proteins Bru and HXB2, clade E (CM240), clade C (92Br), clade D (Eli) and clade A (Ug11RP). It only bound to native TAT protein, and could inhibit Tat-transactivation. Moreau *et al.* [2004] (**antibody binding site definition and exposure**, **subtype comparisons**)

No. 334
MAb ID J3B2
HXB2 Location Tat
Author Location Tat (44–61)
Epitope
Subtype B
Neutralizing yes
Immunogen vaccine
Strain: B clade *HIV component:* Tat
Species (Isotype) human (IgG1λ)
Ab Type Tat basic region
References Moreau *et al.* 2004
Keywords antibody binding site definition and exposure, subtype comparisons

• J3B2: J3B2 is a MAb derived from a Tat-toxoid vaccinated uninfected volunteer. B1E3 recognized two Tat peptides, aa33-37 and aa37-51 of an unspecified HIV-1 clade B Tat protein. J3B2 demonstrates a weak binding affinity to rTAT protein in solution, suggesting that epitope recognition may be conformation dependent, B1E3 did not recognize synthetic HIV-1 clade B Tat proteins Bru and HXB2, clade E (CM240), clade C (92Br), clade D (Eli) and clade A (Ug11RP). It only bound to native TAT protein, and could inhibit Tat-transactivation. Moreau *et al.* [2004] (**antibody binding site definition and exposure**, **subtype comparisons**)

IV-C-14 Rev Antibodies

No. 335
MAb ID 4G9
HXB2 Location Rev (5–15)
Author Location Rev (5–15)
Epitope `SGDSDEELIRT?`
Neutralizing
Immunogen vaccine
Vector/Type: protein *HIV component:* Rev
Species (Isotype) mouse
References Jensen *et al.* 1997

• 4G9: Mapped binding location by protein footprinting. Jensen *et al.* [1997]

No. 336
MAb ID Ab2
HXB2 Location Rev (32–50)
Author Location Rev (32–49 BRU)
Epitope `EGTRQARRNRRRWRERQR`
Neutralizing
Immunogen vaccine
Vector/Type: protein *HIV component:* Rev
Species (Isotype) (IgG1)
Research Contact Tony Lowe and Jonathan Karn, MRC Center, Cambridge
References Henderson & Percipalle 1997

• Ab2: The Ab2 binding site overlaps the nuclear localization signal – Ab2 binding to Rev was blocked by bound HIV RNA – the cellular protein importin-beta can bind in this Arg rich region – atypically, the Rev binds specifically to importin-beta, but not to the importin-beta-importin-alpha dimer. Henderson & Percipalle [1997]

No. 337
MAb ID 10.1
HXB2 Location Rev (33–48)
Author Location Rev (33–48)
Epitope `GTRQARRNRRRRWRER?`
Neutralizing
Immunogen
Species (Isotype)
References Maksiutov *et al.* 2002; Ranki *et al.* 1995; Ranki *et al.* 1994; Ovod *et al.* 1992

• 10.1: This epitope is similar to a fragment of the human protein Complement 4 (containing C4A anaphlylatoxin), GRRNRRRR. Maksiutov *et al.* [2002]
• 10.1: Binds to the RRE binding site – polyclonal anti-Rev Ab detected Rev in astrocytes in 4/5 brain autopsy samples, but only one of these was positive using 10.1, suggesting most Rev was bound to RRE. Ranki *et al.* [1995]

No. 338
MAb ID 3H6
HXB2 Location Rev (38–43)
Author Location Rev (38–44)
Epitope `RRNRRR`
Neutralizing
Immunogen vaccine
Vector/Type: protein *HIV component:* Rev
Species (Isotype) mouse (IgG1κ)
References Maksiutov *et al.* 2002; Orsini *et al.* 1995

• 3H6 database comment: There is another MAb with this ID that recognizes gp41.
• 3H6: This epitope is similar to a fragment of the human protein Complement 4 (containing C4A anaphlylatoxin), GRRNRRRR. Maksiutov *et al.* [2002]
• 3H6: Directed against nucleolar localization/RRE binding domain – antigenic domain tentative, MAb failed to bind a RRNRRR Rev deletion mutant. Orsini *et al.* [1995]

No. 339
MAb ID 8E7
HXB2 Location Rev (70–84)
Author Location Rev (70–84)
Epitope `PVPLQLPPLERLTLD`
Neutralizing
Immunogen vaccine
Vector/Type: protein *HIV component:* Rev
Species (Isotype) mouse (IgG2aκ)

B Cell

References Maksiutov *et al.* 2002; Boe *et al.* 1998; Jensen *et al.* 1997; Szilvay *et al.* 1995; Kalland *et al.* 1994b; Kalland *et al.* 1994a

- 8E7: This epitope is similar fragments of the human protein Epidermal growth factor receptor substrate 15, EPVPMSLPPA, and Insulin-like growth factor binding protein complex acid labile chain precursor, QPPGLERLWLEGNPWDCG. Maksiutov *et al.* [2002]
- 8E7: HIV-1 RNA and Rev localize to the same region in the nucleoplasm, but the splicing factor SC-35 localizes in different speckles with the nucleoplasm than Rev – intron containing beta-globin was distributed similarly to HIV-1, suggesting Rev and HIV-1 RNAs interact at putative sites of mRNA transcriptions and splicing. Boe *et al.* [1998]
- 8E7: Peptide interaction mapped to aa 70-84, 75-88 – protein footprint to 65-88. Jensen *et al.* [1997]
- 8E7: 8E7 worked in indirect immunofluorescence and also detected Rev in WB assays – used to detect localization of Rev in several compartments including the nucleoli, nucleoplasm, perinuclear zone, and cytoplasm – Rev co-localized with host cell factors known to assemble on nascent transcripts – Rev shuttles continuously between cytoplasmic and nucleoplasmic compartments. Kalland *et al.* [1994a,b]; Szilvay *et al.* [1995]

- 2G2: Does not bind to any of a set of glutathione S-transferase (GST) Rev fusion proteins, or to Rev in a RIPA buffer, suggesting a conformational epitope. Orsini *et al.* [1995]

IV-C-15 Vpu Antibodies

No. 347
MAb ID DE7
HXB2 Location Vpu (42–63)
Author Location Vpu (41–62)
Epitope `LIDRLIERAEDSGNESEGEISA`
Neutralizing
Immunogen vaccine
Vector/Type: peptide *HIV component:* Vpu
Adjuvant: BSA
Species (Isotype) mouse (IgG1)
References Gharbi-Benarous *et al.* 2004
Keywords antibody binding site definition and exposure, antibody generation

- DE7: This MAb was generated against the phosphorylated Vpu41-62 peptide. Phosphorylation of Vpu, at the Serines of the DSGXXS motif, is required for interaction of Vpu with the ubiquitin ligase that triggers CD4 degradation and infectious virion release. DE7 bound peptide conformation was analyzed using STD NMR epitope mapping, TRNOESY conformational analysis and molecular dynamics simulation, and found to adopt a compact structure with several bends, including a tight bend at DpSGNEpS. Gharbi-Benarous *et al.* [2004] (**antibody binding site definition and exposure**, **antibody generation**)

IV-C-16 gp160 Antibodies

No. 348
MAb ID M85
HXB2 Location gp160 (30–51)
Author Location gp120 (30–51 LAI)
Epitope `ATEKLWVTVYYGVPVWKEATTT`
Subtype B
Neutralizing no
Immunogen vaccine
Vector/Type: protein *HIV component:* Env
Species (Isotype) mouse (IgG1)
Ab Type gp120 C1
Research Contact Fulvia di Marzo Veronese
References Koefoed *et al.* 2005; Wyatt *et al.* 1997; Ditzel *et al.* 1997; Moore & Sodroski 1996; Moore *et al.* 1994d; Moore *et al.* 1994c; di Marzo Veronese *et al.* 1992
Keywords antibody binding site definition and exposure

- M85: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an alternative to using bone marrow for generating libraries. M85 was among a set of Abs used for competition studies to define the binding sites of the newly isolated MAbs, and has a linear C1 epitope. Koefoed *et al.* [2005] (**antibody binding site definition and exposure**)
- M85: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. Wyatt *et al.* [1997]
- M85: Binding inhibited by MAb 4D4#85, enhanced by conformationally sensitive anti-V3 MAb 5G11, and some anti-18 MAbs. Moore & Sodroski [1996]
- M85: C1 domain – mutation 40 Y/D impairs binding – the relative affinity for denatured/native gp120 is < .01, suggesting conformational component. Moore *et al.* [1994c]
- M85: Immunoblot and RIP reactive for strains IIIB, 451, MN, RF, and RUTZ – binds deglycosylated gp120. di Marzo Veronese *et al.* [1992]

Author Location gp120 (51–70 LAI)
Epitope YDTEVHNVWA
Subtype B
Neutralizing L
Immunogen vaccine
Vector/Type: protein *Strain:* B clade IIIB *HIV component:* gp120
Species (Isotype) mouse (IgG1)
Ab Type gp120 C1
References Pantophlet *et al.* 2004; Moore *et al.* 1994d; Moore *et al.* 1994c; Niedrig *et al.* 1992b
Keywords vaccine antigen design

- 133/237: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 133/237. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 133/237: The relative affinity, denatured/native gp120 is 1.4 – mutation of position 69 W/L impairs binding. Moore *et al.* [1994c]
- 133/237: Region of overlap for reactive peptides is WATHA – weak neutralization of lab strains. Niedrig *et al.* [1992b]

No. 355

Epitope YDTEVHNVWA
Subtype B
Neutralizing L
Immunogen vaccine
Vector/Type: protein *Strain:* B clade IIIB *HIV component:* gp120
Species (Isotype) mouse (IgG1)
Ab Type gp120 C1
Research Contact M. Niedrig
References Pantophlet *et al.* 2003b; Yang *et al.* 2000; Binley *et al.* 1998; Wyatt *et al.* 1997; Binley *et al.* 1997a; Moore & Sodroski 1996; Wyatt *et al.* 1995; Moore *et al.* 1994d; Moore *et al.* 1994c; Thali *et al.* 1993; Niedrig *et al.* 1992b
Keywords vaccine antigen design

- 133/290: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 133/290: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 133/290: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 133/290: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. Wyatt *et al.* [1997]
- 133/290: Reciprocal binding inhibition with the antibody 522-149, that binds to a discontinuous epitope – binding is enhanced by some C5 and C1 binding site antibodies. Moore & Sodroski [1996]
- 133/290: Used for antigen capture assay, either to bind gp120 to the ELISA plate, or to quantify bound gp120. Wyatt *et al.* [1995]
- 133/290: The relative affinity for denatured/native gp120 is 2.2 – mutation in position 69 W/L impairs binding. Moore *et al.* [1994c]
- 133/290: Region of overlap for reactive peptides is WATHA – weak neutralization of lab strains. Niedrig *et al.* [1992b]

Keywords vaccine antigen design

- 133/192: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 133/192. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 133/192: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 133/192: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 133/192: Reciprocal binding inhibition with the antibody 4A7C6 – enhanced by some anti-C5 and-C1 antibodies. Moore & Sodroski [1996]
- 133/192: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- 133/192: The relative affinity for denatured/native gp120 is 1.8. Moore *et al.* [1994c]
- 133/192: C1 region – substitutions 76P/Y, 113 D/A or R, 117 K/W, 420 I/R, 427 W/S impair binding, other substitutions enhanced binding. Moore *et al.* [1994d]
- 133/192: Epitope seems complex, binds multiple peptides – weak neutralization of lab strain. Niedrig *et al.* [1992b]

Immunogen vaccine
Vector/Type: vaccinia prime with gp120 boost *Strain:* A clade *HIV component:* Env
Species (Isotype) mouse
Ab Type gp120 C1
References Sheppard *et al.* 2007b; Holl *et al.* 2006a; Billington *et al.* 2007; Zipeto *et al.* 2005; Jeffs *et al.* 2004
Keywords dendritic cells, neutralization, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- CA13: MRC Centralized Facility for AIDS Reagents, NIBSC, UK, ARP3119.
- CA13: The MAb CA13 binds to the conserved C1 epitope EDIISLW and was used in conjunction with MAb 221, a MAb that binds to the gp120 C-terminal end, to explore the composition and stability of a highly stable trimeric rgp140 derived from a HIV-1 subtype D isolate containing intermonomer V3-derived disulfide bonds and lacking gp120/gp41 proteolytic processing. The stability of the trimer indicates it may be a good candidate for structural studies. Billington *et al.* [2007]
- CA13: This clade A derived Ab was used in the analysis of clade C gp140 (97CN54) antigenicity and was shown to recognize this molecule. Sheppard *et al.* [2007b] (**variant cross-recognition or cross-neutralization**)
- CA13: This Ab did not inhibit HIV-1 BaL replication in macrophages. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- CA13: HIV-1 fusion complexes were prepared from cell lines expressing R5 HIV-1 gp120/gp41 and CD4-CCR5. Neutralizing Abs were raised against both R5 (strain BaL) and X4 (strain 213) viruses. CA13 was used to detect gp120/gp41. Zipeto *et al.* [2005] (**vaccine antigen design**)
- CA13: A set of oligomeric envelope proteins were made from six primary isolates for potential use as vaccine antigens: 92/UG/037 (clade A), HAN2/2 (clade B), 92/BR25/025 (clade C), 92/UG/021 (clade D), 93/BR/029 (clade F) and MVP5180 (clade O). This was one of a panel of MAbs used to explore folding and exposure of well characterized epitopes. The clade C isolate BR25 is apparently misfolded, as conformation-dependent antibodies did not bind to it. CA13 is a MAb that binds to a linear epitope in the C13 region of gp120 that was raised against clade A variant 92/UG/029. C13 bound to antigens from all clades A-F, as well as group O. Polyclonal sera raised in rabbits against these antigens cross-bound the other antigens, but none of the sera had neutralizing activity. Jeffs *et al.* [2004] (**vaccine antigen design**, **subtype comparisons**)

References Yang *et al.* 2000; Kropelin *et al.* 1998; Binley *et al.* 1998; Binley *et al.* 1997a; Trkola *et al.* 1996a; Moore & Sodroski 1996; Moore *et al.* 1994d; Moore *et al.* 1994c; Niedrig *et al.* 1992b

- 135/9: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 135/9: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 135/9: Noted to bind to C1 peptide HEDIISLWDQSLK – blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12) Kropelin *et al.* [1998]
- 135/9: Binding is enhanced by some anti-C1 and anti-C5 antibodies – enhances binding of some anti-V3, anti-C4 and anti-V2 MAbs – 135/9 binds to predicted alpha-helix in C1. Moore & Sodroski [1996]
- 135/9: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- 135/9: The relative affinity for denatured/native gp120 is 15 – mutation 113 D/R impairs binding to native and denatured, 113 D/A only to denatured. Moore *et al.* [1994c]
- 135/9: Substitutions 106 E/A, 113 D/A or R, and 117 K/W impair binding, some substitutions enhance binding. Moore *et al.* [1994d]
- 135/9: Defines the epitope as gp120(114-123) MHEDIISLWD (core LWD?) – weak neutralization of lab strain. Niedrig *et al.* [1992b]

- P1H6: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. When the V1 loop of the heterologous isolates was replaced by the V1 loop present on the DF162go140 immunogen, these isolates became susceptible to neutralization by p1H6. Ching *et al.* [2008] (**neutralization**)
- P1H6: Binding of P1H6 is partially dependent on the conformation of V1, while the presence of V3 is not required. P1H6 neutralized SF162 potently but it did not have any heterologous neutralizing activity. The Ab did not neutralize virus lacking V1. The SF162ΔV2 virus was significantly more susceptible to neutralization by P1H6 than the wildtype virus. Glycans at positions 154 and 195 in V1V2 were involved in regulating P1H6 neutralizing potential. Neutralization by P1H6 was also enhanced strongly by deletion of the V3 glycan at position 299, even more so by deletion at position 329, and only slightly or not at all by deletion of the glycan at position 293. Glycans present in the V4-V5 region had only modest effects on the neutralizing potential of this Ab, where their removal resulted in a more neutralization resistant virus. Derby *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**)

- 697-D: The study evaluated the influence of glycosylation within the V1/V2 domain on antibody recognition. Recombinant proteins, demonstrated to be folded in native conformation, were produced following transfection of CHO cells by plasmids expressing V1/V2 domains from primary isolates of different clades. This Ab was used to validate the functional structure of the recombinant proteins produced. Granados-Gonzalez *et al.* [2008]
- 697-D: This review summarizes 697-D Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- 697D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 697-30D: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. 697-30D showed a decrease in binding to the LLP-2 mutant compared to the wildtype virus, indicating that its epitope was altered by the mutation. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 697-D: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **review**)
- 697-D: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V2 MAb 697-D did not bind to mCHO and had diminished binding to GDMR, while V2 MAb 8.22.2 bound to GDMR but not mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 697-D: In a review of Envelope binding MAbs in this database, V2-specific MAbs are noted to have some ability to neutralize HIV-1, but generally weak with limited cross-reactivity; it weakly neutralizes some primary but not TCLA strains. 697-D is the best characterized of the anti-V2 MAbs, and binds weakly and sporadically to isolates from clades A-D. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**, **subtype comparisons**)
- 697-D: Called 697D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**antibody binding site definition and exposure**)
- 697-D: Called 697D – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A, 4117C and 697D were used as controls. He *et al.* [2002]
- 697-D: This epitope is similar to a fragment of the human protein macrophage colony stimulating factor I receptor SISIRLKVQK. Maksiutov *et al.* [2002]
- 697-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V2 MAbs 697-D, 1357 and 1361 favored the monomer by approximately 2 fold. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 697-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V2 MAb 697-D did not effect proliferation. Hioe *et al.* [2000]
- 697-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 anti-V2 MAbs, which showed weak and sporadic binding, with the most frequent binding to C and D clades. Nyambi *et al.* [2000] (**subtype comparisons**)
- 697-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – V2 Abs 697-D, 1361, and 1357 tended to bind weakly with a similar pattern of specificity to virions, and bound well to soluble gp120: weak binding to 1/4

B Cell

B clade viruses (CA5), and weak binding to viruses from subtype A and D. Nyambi *et al.* [1998] (**subtype comparisons**)

- 697-D: Called 697-30D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. Stamatatos & Cheng-Mayer [1998] (**variant cross-recognition or cross-neutralization**)
- 697-D: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 697-D bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- 697-D: Does not neutralize TCLA strains but neutralizes some primary isolates weakly. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 697-D: Partial inhibition of gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**co-receptor**)
- 697-D: Not neutralizing, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC**, **enhancing activity**)
- 697-D: Review: called 697/30D – neutralizes some primary, but not lab adapted strains. Moore & Ho [1995] (**variant cross-recognition or cross-neutralization**, **review**)
- 697-D: Conformational with weak reactivity to V2 peptide ISTSIRGKVQKEYAFFYKLD – neutralized 3/4 primary isolates, but none of 4 lab strains – V2 substitutions 176/177 FY/AT, 179/180 LD/DL, 183/184 PI/SG, and 192-194 YSL/GSS abrogate binding – anti-C4 MAbs G3-536 and G45-60 enhance binding – mild oxidation of carbohydrate moieties inhibits binding. Gorny *et al.* [1994] (**antibody binding site definition and exposure**)

- C108G: Position 167 in V2 dictates the specificities of three type-specific neutralizing MAbs that bind to an otherwise relatively conserved epitope in involving V2: 2909, C108g, and 10/76b. Introduction of D167G mutation in YU2 Env resulted in significant neutralization by C108G. Removing of glycan at position N131 and V1 glycosylation site 140 resulted in increase in sensitivity to C108G. On the other hand, eliminating the glycan at position 160 in V2 in conjuction with V1 glycan and D167G mutations resulted in large decrease in sensitivity to C108, indicating that the glycan in this position is an important component of the C108G epitope. Honnen *et al.* [2007] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- C108G: This Ab was shown not to react with clade C gp140 (97CN54). Sheppard *et al.* [2007b] (**variant cross-recognition or cross-neutralization**)
- C108G: This MAb is type-specific and neutralizes BaL and HXB2. It is the most potent anti-V2 MAb, is glycan dependent, and contrary to earlier reports requires disulfide bonds. Neutralization by C108g is not mediated by CD4 or CCR5 receptor blockage on the cell surface. Binding to CD4 was inhibited by b12, but not by C108g. Binding to CCR5 was completely inhibited by two V3 MAbs, 4117C and 2219, and was substantially inihibited by 2G12, but was not inhibited by C108g.JR-FL is a neutralization resistant strain; modification of JRFL at positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL.The MAb 10/76b, that binds to a linear V2 epitope that is unaffected by deglycosylation or reduction eliminating disulfinde bonds, could only weakly neutralize this modified JR-FL. Similarly SF162 substitutions in the neutralization sensitive virus SF162 GVK->NMK (167-169) plus the glycoslyation site at 160, created a G108g neutralization sensitive virus. In contrast, 10/76b binds to the NMK substituted variant, but addition of the glycosylation site inhibited binding. Pinter *et al.* [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- C108G: This MAb is unusual among V2-directed MAbs. It is glycan dependent and can neutralize both a primary isolate (BaL and a TCLA (IIIB) strain. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **review**)
- C108G: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – C108G bound and directed lysis against only

B Cell

IIIB – this is first demonstration of ADCC directed by a V2 specific MAb. Alsmadi & Tilley [1998] (**ADCC**, **variant cross-recognition or cross-neutralization**)
- C108G: Inhibits HX10 binding to both CD4 positive and negative HeLa cells. Mondor *et al.* [1998]
- C108G: Viral binding inhibition by C108G was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997] (**antibody binding site definition and exposure**)
- C108G: Synergistic neutralization of HIV-1 when combined with anti-V3 MAbs 0.5beta and C311E, or anti-CD4BS MAbs, 1125H and 5145A – neutralization further enhanced by presence of both 1125H and 0.5beta. Warrier *et al.* [1996] (**antibody interactions**)
- C108G: Characterization of MAb variable region. Warrier *et al.* [1995] (**antibody sequence variable domain**)
- C108G: Strain specificity: LAI, BaL, HXB2 – conformational character – glycosylation site at 160 critical – mutation of conserved glycosylation site at 156 increased epitope exposure. Wu *et al.* [1995] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- C108G: Chimps were infected with HIV-1 IIIB, and this high affinity MAb was obtained from an Epstein-Barr virus transformed B-cell line. It gave potent neutralization of HIV-1 IIIB. Binding was not affected by reduction of disulfide bonds. Binding was disrupted by removal of N-linked glycans. The peptide binds with lower affinity than glycosylated Env. Warrier *et al.* [1994] (**antibody binding site definition and exposure**, **antibody generation**)

- 10/76b: UK Medical Research Council AIDS reagent: ARP3077.
- 10/76b: Position 167 in V2 dictates the specificities of three type-specific neutralizing MAbs that bind to an otherwise realtively conserved epitope in involving V2: 2909, C108g, and 10/76b. Introduction of D167G mutation in YU2 Env resulted in weak neutralization by 10/76b. Removing the glycan at position N131 resulted in increase in sensitivity to 10/76b while removing of V1 glycosylation site 140 had minimal effect. Eliminating the glycan at position 160 in V2 in conjuction with V1 glycan and D167G mutations resulted in an increase in sensitivity to 10/76b, indicating that the glycan in this position acts as a potent masking element for the 10/76b epitope. Honnen *et al.* [2007] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 10/76b: This study is about the MAb C108g, and 10/76b was a control. C108g is type-specific and neutralizes BaL and HXB2. It is the most potent anti-V2 MAb, and is glycan dependent and contrary to earlier reports requires disulfide bonds. Neutralization by C108g is not mediated by CD4 or CCR5 receptor blockage on the cell surface. JR-FL is a neutralization resistant strain; modification of JRFL at positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL.The MAb 10/76b, that binds to a linear V2 epitope that is unaffected by deglycosylation or reduction eliminating disulfinde bonds, could only weakly neutralize this modified JR-FL. Similarly SF162 substitutions in the neutralization sensitive virus SF162 GVK->NMK (167-169) plus the glycoslyation site at 160, created a G108g neutralization sensitive virus. In contrast, 10/76b binds to the NMK substituted variant, but addition of the glycosylation site inhibited binding. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 10/76b: Neutralizes HXB2, but fails to neutralize chimeric virus with gp120 from primary isolates in an HXB2 background. McKeating *et al.* [1996]
- 10/76b: Cross-competes with MAbs 10/76b and 11/4b – HXB2 neutralization escape mutant has the substitution I/T at residue 165. Shotton *et al.* [1995] (**antibody binding site definition and exposure**)
- 10/76b: Included in cross-competition and neutralization studies. Shotton *et al.* [1995] (**antibody binding site definition and exposure**)
- 10/76b: HX10 strain specificity – binds native, deglycosylated, or denatured gp120. Wu *et al.* [1995] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 10/76b: This MAb was obtained from a hybridoma cell line. An R to L substitution abrogated binding. Human sera recognize the 10/76 epitope. McKeating *et al.* [1993b] (**antibody generation**)

- 8.22.2: The study evaluated the influence of glycosylation within the V1/V2 domain on antibody recognition. Recombinant proteins, demonstrated to be folded in native conformation, were produced following transfection of CHO cells by plasmids expressing V1/V2 domains from primary isolates of different clades. This Ab was used to validate the functional structure of the recombinant proteins produced. Granados-Gonzalez *et al.* [2008]
- 8.22.2: This Ab was used to help define the antigenic profile of envelopes used in serum depletion experiments to attempt to define the neutralizing specificities of broadly cross-reactive neutralizing serum. This Ab bound to JR-FL and JR-CSF gp120 monomers but not to core JR-CSF gp120 monomer used in the same experiments. V1, V2, and V3 specificities did not contribute to the broadly neutraling capability of sera from 3 (2 B clade ,1 A clade) HIV infected individuals. Dhillon *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**)
- 8.22.2: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs

B Cell

did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V2 MAb 697-D did not bind to mCHO and had diminished binding to GDMR, while V2 MAb 8.22.2 bound to GDMR but not mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)

- 8.22.2: This broad review of anti-Envelope MAbs notes that V2 MAbs are generally weakly neutralizing at best, and somewhat strain specific. 8.22.2 weakly neutralizes SF162. Gorny & Zolla-Pazner [2004] (**review**)
- 8.22.2: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 8.22.2. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 8.22.2: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype.Three anti-V2 MAb were tested – 8.22.2 weakly neutralized SF162, and did not neutralize JRFL at all. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 8.22.2 : Transgenic mice (strain XenoMouse G2) carrying human genes allowing production of fully human IgG2kappa MAbs were used to rapidly create a panel of anti-HIV gp120 MAb-producing hybridomas by immunization with HIV SF162 gp120 – several of the MAbs obtained were effective at neutralizing the autologous strain – 8.22.2 was the only V2-specific MAb created and it could cross-compete with MAb 697D – 8.22.2 could cross-react with BaL and JR-FL, two B clade R5 strains, but not B clade X4 or E clade viruses, and it could weakly neutralize autologous strain SF162. He *et al.* [2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 8.22.2: This epitope is similar to a fragment of the human protein macrophage colony stimulating factor I receptor SISIRLKVQK. Maksiutov *et al.* [2002]

- G3-136: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- G3-136: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V2 MAb used. Zwick *et al.* [2003] (**antibody interactions**)

B Cell

- G3-136: Called G3.136 – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000]
- G3-136: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- G3-136: Called G3.136 – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. Stamatatos & Cheng-Mayer [1998]
- G3-136: Called G3.136 – does not mediate gp120 virion dissociation in contrast to anti-V2 MAb G3-4 – not neutralizing for SF162 or SF128A in either primary macrophages or PBMC. Stamatatos *et al.* [1997]
- G3-136: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997]
- G3-136: Described epitope as STSIRGKVKEYAFFYKLDI – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT123 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. Poignard *et al.* [1996a]
- G3-136: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes cell free Hx10. Sattentau & Moore [1995]
- G3-136: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V2 loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a – anti-V2 MAbs G3-4 and G3.136 don't bind to T-cell tropic SF2. Stamatatos & Cheng-Mayer [1995]
- G3-136: HIV-1 RF V2 substitutions 177 Y/H and 179 L/P in the V2 loop of RF reduce affinity. Yoshiyama *et al.* [1994]
- G3-136: Conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
- G3-136: Marginal binding to peptide, binding inhibited by 183/184 PI/SG substitution. Moore *et al.* [1993a]
- G3-136: Binding enhanced by selected antibodies to C1, C4, C5, V3 and anti-CD4 binding site MAbs – enhances binding of selected V3, C4 and anti-CD4 binding site MAbs. Moore *et al.* [1993a]
- G3-136: V2 region – binds and neutralizes IIIB and RF in CEM-SS cells, but not MN – neutralization activity against a few primary isolates in PBMC – sCD4 binding inhibits binding (contrast with BAT085) – deglycosylation or reduction of gp120 by DTT diminishes reactivity. Fung *et al.* [1992]

Keywords	antibody binding site definition and exposure, antibody interactions, binding affinity, vaccine antigen design

- G3-4: This Ab bound to Fc-gp120 construct but not to the chimeras missing the V2 loop. Binley *et al.* [2006] (**binding affinity**)
- G3.4: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). Deletion of the crown of the V2 loop reduced the binding of G3.4. This Ab also recognized ΔV3gp140 less efficiently than SF162gp140 and recognized ΔV2ΔV3gp140 less efficiently than ΔV2gp140, indicating that deletion of the V3 loop has an effect on the binding of G3.4. Derby *et al.* [2006] (**antibody binding site definition and exposure**)
- G3-4: 2909 is a human anti-Env NAb that was selected by neutralization assay and binds to the quaternary structure on the intact virion. G3-4 was used as a positive control for defining the binding properties of 2909. Gorny *et al.* [2005]

- G3-4: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The SF2 and all five glycan mutants were resistant to G3-4. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- G3-4: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including G3-4. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- G3-4: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- G3-4: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V2 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- G3-4: Called G3.4 – Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – G3.4 recognized o-gp140. Srivastava *et al.* [2002]
- G3-4: Called G3.4 – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000]
- G3-4: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- G3-4: Called G3.4 – Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V2 MAbs G3.4, G3.136, or 687-30D. Stamatatos & Cheng-Mayer [1998]
- G3-4: Called G3.4 – mediates gp120 virion dissociation in contrast to anti-V2 MAb G3-136 – not neutralizing for SF162 or SF128A in either primary macrophages or PBMC. Stamatatos *et al.* [1997]
- G3-4: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997]
- G3-4: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – deletion of the V3 loop from gp120 results in more potent G3-4 binding inhibition by CRDS – G3-4 epitope described as 176-184 FYKLDIIPI and 191-193 YSL. Jagodzinski *et al.* [1996]
- G3-4: Binding enhanced by selected antibodies to C1, C4, C5, V3 and anti-CD4 binding site MAbs – enhances binding of selected V3, C4 and anti-CD4 binding site MAbs. Moore & Sodroski [1996]
- G3-4: Described epitope as STSIRGKVKEYAFFYKLDI – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT085 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. Poignard *et al.* [1996a]
- G3-4: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes Hx10 cell-free virus. Sattentau & Moore [1995]
- G3-4: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V2 loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a – anti-V2 MAbs G3-4 and G3.136 don't bind to T-cell tropic SF2. Stamatatos & Cheng-Mayer [1995]
- G3-4: Reactive with BH10, RF, and MN – binds native, but not denatured or deglycosylated gp120, binds to deglycosylated V1V2 fusion protein, suggesting importance of glycans outside the V1V2 region. Wu *et al.* [1995]
- G3-4: Weakly neutralizing, IC 50 = 53 mug/ml. Gorny *et al.* [1994]
- G3-4: Conformationally sensitive – sporadic cross-reactivity among, and outside, B clade gp120s. Moore *et al.* [1994b]

- G3-4: gp41 mutation (582 A/T) that reduces neutralization of anti-CD4 binding site MAbs does not alter G3-4s ability to neutralize. Thali *et al.* [1994]
- G3-4: Neutralizes RF – substitutions 177 Y/H and 179 L/P in the V2 loop of RF reduce affinity and result in neutralization escape. Yoshiyama *et al.* [1994]
- G3-4: Conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
- G3-4: V2 region, marginal binding to peptide, binding inhibited by 183/184 PI/SG substitution. Moore *et al.* [1993a]
- G3-4: Increased binding in the presence of sCD4. Sattentau *et al.* [1993]
- G3-4: Substitutions in residues 176 to 184 affect MAb recognition – substitutions in V2 can result in gp120-gp41 dissociation. Sullivan *et al.* [1993]
- G3-4: Neutralizes IIIB and RF, not MN – blocks sCD4-gp120, not as potent as MAb 15e – V2 binding MAbs BAT085 and G3-136 block G3-4 gp120 binding – sensitive to reduction of gp120 by DTT. Ho *et al.* [1992]
- G3-4: Binding is sensitive to removal of glycans by endo H – 50% neutralization of 4/9 primary isolates – has conformational features. Ho *et al.* [1991a]

No. 431
MAb ID BAT085 (BAT-085)
HXB2 Location gp160 (171–180)

Neutralizing L
Immunogen vaccine
Vector/Type: inactivated HIV *Strain:* B clade IIIB *HIV component:* HIV-1
Species (Isotype) mouse (IgG1)
Research Contact Tanox Biosystems Inc and David Ho, ADARC, NY
References Kanduc *et al.* 2008; Parren *et al.* 1998a; Ditzel *et al.* 1997; Binley *et al.* 1997a; Poignard *et al.* 1996a; Moore & Sodroski 1996; Sattentau & Moore 1995; Wu *et al.* 1995; Yoshiyama *et al.* 1994; Gorny *et al.* 1994; Moore *et al.* 1994d; D'Souza *et al.* 1994; Moore *et al.* 1993a; Thali *et al.* 1993; Pirofski *et al.* 1993; Moore & Ho 1993; Fung *et al.* 1992; Fung *et al.* 1987

- BAT085: Similarity level of the BAT085 binding site pentapeptide EYAFF to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 0 times, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- BAT085: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- BAT085: Binding is blocked by other V2 region antibodies, enhanced by several anti-C1 MAbs, and anti-V3 MAb G511 – reciprocal enhancement of CD4i MAb 48d binding. Moore & Sodroski [1996]
- BAT085: Epitope suggested to be QKEYAFFYKLD – binds oligomer – binding of V2 MAbs G3-136, G3-4 or BAT123 did not significantly alter gp120 dissociation from virus or expose the gp41 epitope of MAb 50-69, in contrast to anti-V3 MAbs. Poignard *et al.* [1996a]
- BAT085: Bound preferentially to the monomeric rather than oligomeric form of LAI gp120 – neutralizes cell free Hx10. Sattentau & Moore [1995]
- BAT085: HXB10 strain specificity – binds native, deglycosylated, or denatured gp120. Wu *et al.* [1995]
- BAT085: Multi-lab study for antibody characterization and assay comparison – did not bind MN or SF2. D'Souza *et al.* [1994]
- BAT085: Interacts with two overlapping peptides with region of overlap KEYAFFYKLD. Gorny *et al.* [1994]
- BAT085: Neutralizes RF – substitution 177 Y/H in the V2 loop of RF does not inhibit neutralization, in contrast to MAbs G3-4 and SC258. Yoshiyama *et al.* [1994]
- BAT085: Called BAT-85 – conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120, and does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
- BAT085: 7/8 V2 murine MAbs required gp120 native structure to bind, but BAT085 was the exception – type-specific. Moore *et al.* [1993a]
- BAT085: Peptide affinities of G3-136 and G3-4 are 100-fold less than BAT085, but BAT085 has lower affinity for BH10 gp120 and is weaker at neutralization. Moore *et al.* [1993a]
- BAT085: V2 region – sCD4 does not block – neutralizes IIIB and some primary isolates, but not MN or RF – binds MN – deglycosylation or DDT reduction of gp120 does not diminish reactivity. Fung *et al.* [1992]

Keywords antibody binding site definition and exposure, co-receptor, dendritic cells, enhancing activity, neutralization

- IIIB-V3-21: UK Medical Research Council AIDS reagent: ARP3048.
- IIIB-V3-21: NIH AIDS Research and Reference Reagent Program: 1725.
- V3-21: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. In addition, V3-21 inhibited transmission of CCR5-tropic viruses while transmission of V3-21-neutralized X4 variants increased, indicating that X4 HIV-1 has an advantage over R5 in transmission when neutralized with V3-21. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)
- The role of DC-specific ICAM-grabbing nonintegrin (DC-SIGN) as a potential receptor for HIV-1 in the capture and transfer of neutralized HIV-1 to CD4 T lymphocytes was studied. The nonneutralizing V3-21 enhanced HIV-1 infection upon capture and transfer via Raji-DC-SIGN cells, whereas no infection was observed with the neutralizing b12 MAb,indicating that different Abs have variant effects on inhibiting HIV-1 transfer to CD4 T lymphocytes. van Montfort *et al.* [2007] (**enhancing activity**, **neutralization**, **dendritic cells**)
- IIIB-V3-21: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin, but anti-V3 MAb IIIB-V3-21 was not decreased in either case. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- IIIB-V3-21: This epitope is similar to a fragment of the FasI receptor precursor (Apptosis-mediating surface antigen fas) (APO- 1 antigen) (CD95 antigen), VEINCTRQN. Maksiutov *et al.* [2002]
- IIIB-V3-21: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate be-

B Cell

tween the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- IIIB-V3-21: Does not block HIV-1 LAI binding or entry into CEM cells. Valenzuela *et al.* [1998]
- IIIB-V3-21: Binds to NP40 treated gp120, and epitope is probably obscured by local glycosylation. Laman *et al.* [1993]
- IIIB-V3-21: Binds to the base of the V3 loop on denatured gp120. Laman *et al.* [1992]

Species (Isotype) humanized mouse (IgG2κ)
Ab Type gp120 V3
Research Contact Abraham Pinter, Lab. of Retrovirology, Public Research Institute, pinter@phri.org
References He *et al.* 2003
Keywords antibody binding site definition and exposure, vaccine antigen design
- 168B8: Vaccination of a gp120-CD4 fusion complex in six transgenic XMG2 XenoMouse mice that produce human IgG2 with K light chain did not produce any neutralizing antibodies. 36/39 MAbs derived from one of these mice were in one of two competition groups that were conformational and specific for the complex, suggesting this chimeric vaccine may be of little value, as immunodominant responses are to epitopes unique to the complex, not present in native Env. This MAb is one of the 3/36 non-neutralizing MAbs that bound to linear epitopes on gp120. He *et al.* [2003] (**antibody binding site definition and exposure**, **vaccine antigen design**)

- 9284: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- 9284: In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, 9284 was found to have an inaccessible epitope on the oligomeric form of Env and anti-V3 MAbs were found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan more efficiently than HIV-BRU. Schonning *et al.* [1998]
- 9284: Virus with the V1-V2 loop deleted was viable and more susceptible to neutralization by CD4i MAb 17b, and anti-V3 MAbs 1121, 9284, and 110.4, but not to and CD4BS MAb F105 or sCD4. Cao *et al.* [1997b]
- 9284: Binds V3 loop – anti-C1 MAbs 133/290 and 135/9 enhance binding – reciprocal binding inhibition of other anti-V3 MAbs. Moore & Sodroski [1996]
- 9284: V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus, mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. Poignard *et al.* [1996a]
- 9284: Binds equally well to monomer and oligomer, rapid association and potent neutralization of lab strains – neutralizes cell-free virus Hx10. Sattentau & Moore [1995]
- 9284: Used to monitor HIV-1 Env expression in infected H9 cells, binds native and reduced gp120s similarly. VanCott *et al.* [1995]
- 9284: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. Cook *et al.* [1994]
- 9284: Binding domain aa 301-310: TRKSIRIQRG – mutations in the V3 loop from basic residues can destroy virus infectivity and syncytium formation: R306T, R309T and R313G can also reduce binding of V3 MAbs with two different binding sites: 9284 and 0.5beta – called NEA9284. Okada *et al.* [1994]
- 9284: Did not neutralize infection of HIV/HTLV-I pseudotype. Sorensen *et al.* [1994]
- 9284: gp41 mutation that confers resistance to neutralization by anti-CD4 binding site antibodies does not reduce neutralizing efficiency of this V3 region MAb. Thali *et al.* [1994]
- 9284: Does not bind MN gp120, just IIIB. VanCott *et al.* [1994]
- 9284: Inhibits C4 region antibodies (G3-299, G3-519) which have conformational requirements. Moore *et al.* [1993b]
- 9284: Increased binding in the presence of sCD4. Sattentau *et al.* [1993]
- 9284: Peptide RIQRGPGRAFVTIGKIGNMRQA – Reacts with three human brain proteins of 35, 55, 110 kd – called NEA-9284. Trujillo *et al.* [1993]
- 9284: Single amino acid substitutions in the C4 region (427 W/V or W/S) or at the base of the V3 loop (298 R/G) can significantly increase binding and neutralization– position 427

B Cell

is also important for CD4 binding and anti-CD4 binding site MAbs. Wyatt *et al.* [1992]
- 9284: Two fold increase in binding to gp120 in the presence of bound sCD4. Sattentau & Moore [1991]
- 9284: IIIB type-specific binding and neutralization. Skinner *et al.* [1988b]

Research Contact Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center)
References Gorny *et al.* 2004; Gorny & Zolla-Pazner 2004; Nyambi *et al.* 2000; Gorny *et al.* 2000; Zolla-Pazner *et al.* 1999b; Zolla-Pazner *et al.* 1999a
Keywords antibody binding site definition and exposure, antibody generation, review, subtype comparisons, variant cross-recognition or cross-neutralization

- 1334-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1334-D: Called 1334. V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using HIV451 gp120. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 1334-D: Called 1334 – binds to V3 peptides from MN, SF2, NY5, RF, and CDC4 strains as well as x-reactivity with peptides from A, C, D, F, G, and H subtypes – was suggested to be IgG1lambda here – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 1334-D: Called 1334D – A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1334D showed intermediate cross-reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1334-D: This MAb was selected using oligomeric gp160 from HIV451. Zolla-Pazner *et al.* [1999a] (**antibody generation**)
- 1334-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)

B Cell

Keywords antibody generation, review, subtype comparisons, variant cross-recognition or cross-neutralization

- 1324-E: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1324-E: Called 1324E – A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1324E showed poor cross-reactivity, and was the only MAb tested that was derived from a non-B clade infected patient, an E clade infection was the source of 1324E. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1324-E: E clade stimulated MAb did not cross-react with B clade peptides nor did B clade derived peptides with an E clade V3 loop, but both E and B clade stimulated Abs can cross-react with some peptides from other clades – this Ab showed strong binding to several E, A and F peptides, one C peptide, and no reactivity with B peptides and most D peptides. Zolla-Pazner *et al.* [1999a] (**subtype comparisons**)
- 1324-E: MAb reacted with peptides from E clade, while B clade derived MAbs could not. Zolla-Pazner *et al.* [1999b] (**subtype comparisons**)
- 1324-E: A human MAb was derived from an HIV-1 E clade infection from a US service man who had served in Thailand, selected with the consensus V3 peptide from clade E – cross-reactive with V3 peptides, and gp120 from E, C and A clades, as well as cells infected with a C-clade primary isolate, but not with B and D clade V3 peptides or rgp120 – neutralizes E clade virus adapted for growth in H9 cells, but not 5 primary E clade isolates, including the autologous isolate – kinetic parameters were measured, 1324E was comparable to 447-52D. Gorny *et al.* [1998] (**antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

Keywords antibody binding site definition and exposure, antibody generation, isotype switch, mucosal immunity, neutralization, subtype comparisons, variant cross-recognition or cross-neutralization

- D19: Several IgG MAbs were isotype switched to IgA and tested for their abilities to generate immune complexes with HIV-1 and be excreted from polarized epithelial cells from the basolateral to the apical surface via polymeric Ig receptor (pIgR) binding. IgA D19 was able to excrete HIV but it had lower level of binding to the virus, and as immune complex to the pIgR, than D10 and D47 MAbs. These results show

B Cell

that IgA Abs have potential to excrete HIV from mucosal lamina propria thus decreasing the viral burden and access to susceptible cells. Wright *et al.* [2008] (**isotype switch**, **mucosal immunity**)

- D19: By isotype switching, IgG and IgA variants of D19 were produced. Both D19 IgA and IgG neutralized virus in conventional neutralization assays, however, IgA performed better. D19 IgA was also internalized into the cells by the polymeric Ig receptor (pIgR) and showed capability of intracellular neutralization of HIV-1, while D19 IgG showed no such activity. Huang *et al.* [2005b] (**isotype switch**, **neutralization**, **mucosal immunity**)
- D19: The epitope for D19 is conserved and embedded in V3. D19 is unique because for R5 viruses, it was cryptic and did not bind without exposure to sCD4, but for X4 and R5X4 isolates it was constitutively exposed. It had a similar overlapping binding region with MAbs 447-52D, B4e8, and 268-D, but different reactivity patterns and fine specificity; D19 binding to monomeric gp120 was independent of sCD4, the dependence was only seen in the context of native oligomeric Env. D19 reacted with 23/29 B clade Envs, but to only 2/14 viruses from other clades: one A and one F, but no C, D or E clade strains. D19 can neutralize X4 and R5X4 isolates, but could only neutralize R5 isolates in the presence of sCD4. The authors suggest that a more exposed V3 loop may facilitate CXCR4 coreceptor usage, but that this phenotype is limited in vivo by neutralizing antibodies until the onset of progressive disease. Lusso *et al.* [2005] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 412-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 412-D: Called 412: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 412-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 412-D showed limited reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 412-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review**, **subtype comparisons**)
- 412-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 391.5, 412 and 418, all selected with MN V3 peptide – the core amino acids HIGPGR tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 412-D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite

variable for V3 MAbs, 412-D has a relatively fast dissociation, thus low affinity among V3 MAbs. Gorny *et al.* [1998] (**kinetics**)

- 412-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 412-D was bound only to B clade virions and to D clade MAL. Nyambi *et al.* [1998] (**subtype comparisons**)
- 412-D: Called 412 – The tip of the V3 loop was presented in a mucin backbone – higher valency correlates with higher affinity constant. Fontenot *et al.* [1995] (**vaccine antigen design**, **binding affinity**)
- 412-D: Called 412-10D – relatively rapid dissociation and weak homologous neutralization. VanCott *et al.* [1994] (**binding affinity**)
- 412-D: Neutralizes MN, does not bind SF2 or HXB2 – not reactive with hexa or heptapeptides by Pepscan. Gorny *et al.* [1993] (**variant cross-recognition or cross-neutralization**)
- 412-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG. Spear *et al.* [1993] (**complement**)

- 257-D: UK Medical Research Council AIDS reagent: ARP3023.
- 257-D: NIH AIDS Research and Reference Reagent Program: 1510.
- 257-DI V: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. 257-D belonged to the group 2 MAbs, which are able to bind subtype B but not subtype C gp120, and are able to bind both V3 peptides. 257-D was able to bind subtype B V3 in the subtype C Env backbone chimera, but not the reverse, indicating that 257-D binds to a structure created by the subtype B V3 sequence that is not impacted by the gp120 backbone. For subtype B, 257-D required an R18 residue in order to bind, but the binding was not significantly affected by the H13R change. For subtype C, Q18R mutation did not restore binding to gp120, but the R13H-Q18R double mutation did. Peptide binding was affected only by the R13H mutation, indicating that the poor binding of Q18R gp120 mutant has a structural basis. 257-D was able to neutralize SF162, and a chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. Patel *et al.* [2008] (**neutralization**, **binding affinity**, **subtype comparisons**)
- 257-D IV: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 257-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 257-D: Called 257: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides do not show as much ability to neutralize as V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 257 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 257-D: Called ARP3023: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. Vella *et al.* [2002] (**assay development**)
- 257-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**variant cross-recognition or cross-neutralization**)
- 257-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and

B Cell

TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001]

- 257-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 257-D showed intermediate reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 257-D: Called 257D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
- 257-D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 257-D bound rgp120 W61D but could only neutralize the W61D isolate following T-cell line adaptation. Beddows *et al.* [1999] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **vaccine-specific epitope characteristics**)
- 257-D: Study of a live-vector mucosal vaccine that expresses HIV-1 V3 domains using the bacterium Streptococcus gordonii which can express heterologous Ag and can colonize the oral cavity and vagina of mice – 268-D and 257-D recognized S. gordonii expressing the V3 domain of MN – the vaccine stimulated V3-specific IgG2a in mice. Oggioni *et al.* [1999] (**vaccine antigen design**)
- 257-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review**, **subtype comparisons**)
- 257-D: MAb peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 257-D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 257-D has a slow dissociation, thus the highest affinity among V3 MAbs. Gorny *et al.* [1998] (**kinetics**, **binding affinity**)
- 257-D: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. LaCasse *et al.* [1998] (**co-receptor**, **variant cross-recognition or cross-neutralization**)
- 257-D: Called 257D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V3 MAbs 391-95D or 257D. Stamatatos & Cheng-Mayer [1998] (**vaccine antigen design**, **subtype comparisons**)
- 257-D: A neutralization assay was developed based on hemi-nested PCR amplification of the LTR (HNPCR) – LTR-HNPCR consistently revealed HIV DNA and was shown to be a rapid, specific and reliable neutralization assay based on tests with 6 MAbs and 5 isolates. Yang *et al.* [1998] (**assay development**)
- 257-D: Called 257 – gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. Hill *et al.* [1997] (**antibody binding site definition and exposure**, **co-receptor**)
- 257-D: Neutralized (>90%) an SI-env chimeric virus and enhanced (>200%) an NSI-env chimeric virus. Schutten *et al.* [1997] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- 257-D: Binds less extensively than MAb 391-95D on the surface of HIV-1 isolates SF162 and SF128A – neutralizes less potently than 391-95D – stronger neutralization of primary macrophage targets than PBMC. Stamatatos *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 257-D: IIIB neutralizing MAbs *in vitro* fail to neutralize in a mouse model *in vivo*. Schutten *et al.* [1996]
- 257-D: 257-D is V H5 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- 257-D: Called 257-D-IV – could neutralize MN and closely related JRCSF, but not 2 B subtype and 1 D subtype primary isolates in a multi-laboratory study involving 11 labs. D'Souza *et al.* [1995] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 257-D: Only inhibition of SI phenotype virus, and strong enhancement of NSI phenotype chimeric viruses, that incorporated different envs from the same donor. Schutten *et al.* [1995a] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- 257-D: Comparable affinity for SI and NSI viruses, in contrast to MAb MN215. Schutten *et al.* [1995b] (**variant cross-recognition or cross-neutralization**)
- 257-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 better revealed this V3 epitope on TCLA SF2 and dual tropic (MU3) viruses than on macrophage tropic isolates. Stamatatos & Cheng-Mayer [1995] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 257-D: In serotyping study using flow-cytometry, bound only to virus with KRIHI. Zolla-Pazner *et al.* [1995] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

B Cell

- 257-D: Included a multi-lab study for antibody characterization and assay comparison – best NAb against MN, but not IIIB. D'Souza *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- 257-D: Potent MN neutralization, slow dissociation constant. VanCott *et al.* [1994] (**binding affinity**)
- 257-D: Additive MN or SF2 neutralization when combined with CD4 binding site MAb F105 – does not neutralize RF. Cavacini *et al.* [1993a] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 257-D: Neutralizes MN – binds SF2: epitope KSIYI – specificity: MN, SF2, NY5, RF. Gorny *et al.* [1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 257-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG – complement mediated virolysis of MN, but not in the presence of sCD4. Spear *et al.* [1993] (**complement**)
- 257-D: Reacts with MN, NY5, CDC4 and SF2, does not cross-react with RF, WM52, or HXB2. Karwowska *et al.* [1992b] (**variant cross-recognition or cross-neutralization**)
- 257-D: Called 257-2-D-IV – potent neutralizing MAb. D'Souza *et al.* [1991]

Keywords	antibody binding site definition and exposure, antibody generation, complement, review, subtype comparisons

- 311-11-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 311-11-D: Called 311: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides do not neutralize as well as V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 311 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 311-11-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 311-11-D showed weak reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 311-11-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review**, **subtype comparisons**)
- 311-11-D: MAb peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 311-11-D: Neutralizes MN – binds SF2: KSIYIGP. Gorny *et al.* [1993] (**antibody binding site definition and exposure**, **antibody generation**)
- 311-11-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG. Spear *et al.* [1993] (**complement**)

References	Kanduc *et al.* 2008; Gorny & Zolla-Pazner 2004; Alsmadi & Tilley 1998; Pinter *et al.* 1993b
Keywords	ADCC, review, variant cross-recognition or cross-neutralization

- 41148D: Similarity level of the 41148D binding site pentapeptide IHIGP to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 1 time, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 41148D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. 4117C and 41148D are anti-V3 MAbs that neutralize TCLA strains. Gorny & Zolla-Pazner [2004] (**review**)
- 41148D: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – bound and directed lysis against strains IIIB, MN, SF-2, comparable to 4117C, however 41148D is 10x less efficient at neutralization, showing ADCC and neutralization don't always correlate. Alsmadi & Tilley [1998] (**ADCC**)
- 41148D: Neutralizes less potently than 4117C, reacts with MN, IIIB, SF2. Pinter *et al.* [1993b] (**variant cross-recognition or cross-neutralization**)

Keywords acute/early infection, antibody binding site definition and exposure, binding affinity, co-receptor, dendritic cells, enhancing activity, neutralization, review, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- 391-95d: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. 391-95d recognized both B and C trimers with similar efficiency, indicating that the conformational epitope recognized by this Ab is exposed and preserved in the subtype C trimers. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)
- 391-D: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 391/95-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 391/95-D: Called 391/95: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides do not show as much ability to neutralize as V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 391/95 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 391/95-D: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of any of the five glycans, within the V3 loop (GM299 V3), C2 (GM292 C2), C3 (GM329 C3), C4 (GM438 C4), or V5 (GM454 V5) made SF162 become sensitive to 391/95-D; SF162 is resistant to 391/95-D neutralization. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 391/95-D: The affect of Ab binding on infectivity was studied by pseudotyping three related envs with different phenotypes – R5 viruses were preferentially enhanced, not X4 – the V3 region was the main determinant of Ab-mediated enhancement and modulation of the interaction between CCR5 and gp120 is critical – tests with MAbs anti-V3 391/95-D and CD4BS-specific GP68 indicate that Ab specificity did not determine whether or not infectivity was enhanced or neutralized, rather the phenotype was determined by Env conformation. Guillon *et al.* [2002b] (**co-receptor**, **enhancing activity**)
- 391/95-D: The phenotype and genotype of viral env sequences were studied over a period of seroconversion in one individual – Env trans-complementation demonstrated infectivity of clones derived pre-seroconversion were not influenced by MAb 391/95-D, but post-seroconversion clones were enhanced in the presence of 391/95-D, although the V3 binding region was unchanged – a change in the CD4-binding site was observed (NL43 427 Glu–>Lys) to be present in the post-seroconversion 391/95-D enhanced clone (see Guillon *et al.* [2002b]) Lawson *et al.* [2002]. Guillon *et al.* [2002b]; Lawson *et al.* [2002] (**enhancing activity**, **acute/early infection**)
- 391/95-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 391/95-D: Called 391-95D – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000] (**antibody binding site definition and exposure**)
- 391/95-D: Called 391/95D – six mutations in MN change the virus from a high-infectivity neutralization resistant pheno-

B Cell

type to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000] (**antibody binding site definition and exposure**)
- 391/95-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review**, **subtype comparisons**)
- 391/95-D: Called 391.5 – MAb peptide-reactivity pattern clustered with immunological related MAbs: 391.5, 412 and 418, all selected with MN V3 peptide – the core amino acids HIGPGR tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 391/95-D: Called 391-95D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V1 or V2 did not enable neutralization by V3 MAbs 391-95D or 257D. Stamatatos & Cheng-Mayer [1998] (**antibody binding site definition and exposure**, **subtype comparisons**)
- 391/95-D: Called 391-95D – binds more extensively than MAb 257-D on the surface of HIV-1 isolates SF162 and SF128A – neutralizes more potently than 257-D – stronger neutralization of primary macrophage targets than PBMC – binding post-gp120-sCD4 association related to anti-V3 Abs neutralizing capacity. Stamatatos *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 391/95-D: Competition ELISAs with serial deletions estimated the epitope to be KRIHIGPGRAFY – unconstrained peptide had higher affinity than cyclic. Seligman *et al.* [1996] (**antibody binding site definition and exposure**)
- 391/95-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 better revealed this V3 epitope on macrophage tropic and dual tropic (MU3) viruses, but not in TCLA SF2. Stamatatos & Cheng-Mayer [1995] (**antibody binding site definition and exposure**)
- 391/95-D: Neutralizes MN – binds to SF2, not IIIB. Gorny *et al.* [1993]

- DO142-10: This review summarizes DO142-10 Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- DO142-10: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **review**)

B Cell

- DO124-10: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. DO124-10 neutralizes some TCLA strains. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**)
- D0124-10: Called D0124. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- DO142-10: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different that Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**variant cross-recognition or cross-neutralization**, **binding affinity**)
- DO124-10: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by subneutralizing concentrations of sCD4 and the effect is dependent of CCR5 – Fab Ab fragment DO124-10 also enhances YU2 entry, ruling out Fc interactions or Env cross-linking as a mechanism – while DO124-10 enhances YU2 entry 6-fold, it neutralizes HXBc2 under identical conditions. Sullivan *et al.* [1998a] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- DO142-10: Phage expression libraries panned against MN peptide were used to select Fab DO142-10 – Fab binds MN gp120, but not a primary isolate rec gp120. Ditzel *et al.* [1997] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- DO142-10: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- DO142-10: Binds to gp120 MN and an MN V3 peptide with equal affinity, but binds a consensus B peptide and JRCSF less well, and to IIIB gp120 not at all. Parren & Burton [1997] (**variant cross-recognition or cross-neutralization**, **binding affinity**)
- DO142-10: Fab fragment – competition ELISAs with serial deletions defined the epitope KRIHIGPGRAFYTT. Seligman *et al.* [1996] (**antibody binding site definition and exposure**, **antibody generation**)

- SF162ΔV2 is a virus that has a 30 amino acids deletion in the V2 loop that does not abrogate its infectivity but renders it highly susceptible to neutralization – when incorporated into a codon-optimized DNA vaccine with a CMV promoter, delivered by gene gun, SF162Δ2 gave higher neutralizing Ab titers against SF162 than did SF162 itself, and Abs that cross-neutralized non-homologous primary isolates were obtained only when SF162ΔV2, but not intactSF162, was used as the immunogen – NAbs titers specific for SF162 increased with multiple immunizations, while titers for non-homologous isolates decreased, but anti-V3 peptide binding Abs were not likely the source of this distinction because anti-V3 titers were much lower than those against the entire envelope, and the second booster immunization did not increase the titer of anti-V3 loop Abs. Barnett *et al.* [2001]

- 50.1: The crystal structure of V3-reactive antibody-peptide complexes were examined. 50.1 completely surrounded V3, suggesting a high degree of accessibility for generating an immune response. Accessibility of V3 to this MAb is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- 50.1: This review summarizes data on crystallographic structures of 50.1 binding to its V3 peptide antigens. Conformation of the V3 peptide bound to 50.1 is very similar to its conformation when bound to 447-52D. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 50.1: Called R/V3-50.1 – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 50.1: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding

B Cell

– the dissociation constant, Kd of 50.1 for the cell associated primary and TCLA Envs was equal, 7nM. York *et al.* [2001]

- 50.1: Called R/V3-50.1 – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes – 50.1 could only neutralize the sensitive form. Park *et al.* [2000]
- 50.1: The crystal structure of V3 loop peptides bound to Fabs was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different Fabs were bound. Stanfield *et al.* [1999]
- 50.1: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. LaCasse *et al.* [1998]
- 50.1: Binds to 6/7 isolates from breakthrough cases from a MN gp120 vaccine trial. Berman *et al.* [1997]
- 50.1: Competition ELISAs with serial deletions produced comparable estimate of epitope length to crystal structure and alanine substitution – KRIHIGP. Seligman *et al.* [1996]
- 50.1: Used to monitor HIV-1 Env expression in infected H9 cells. VanCott *et al.* [1995]
- 50.1: No neutralization of primary isolate JR-CSF – greater affinity for and neutralization of T cell tropic strain T-CSF, derived from JR-CSF. Bou-Habib *et al.* [1994]
- 50.1: Shows modest cross-reactivity among B clade gp120s, little outside B clade. Moore *et al.* [1994b]
- 50.1: Chimeric MN V3 loop in an HXB2 background allows increased FACS signal, Ab affinity, and viral neutralization. Robert-Guroff *et al.* [1994]
- 50.1: Potent MN neutralization, slow dissociation rate. VanCott *et al.* [1994]
- 50.1: Crystal structure of a 24 amino acid peptide from the V3 loop bound to 59.1 and 50.1 Fab fragments – epitope KRIHIGP. Ghiara *et al.* [1993]
- 50.1: No synergistic neutralization of MN when combined with CD4BS MAb F105 – isotype stated to be IgG2a. Potts *et al.* [1993]
- 50.1: Crystal structure of V3 loop bound to 50.1 – light chain binds just to the left of GPG, heavy chain binds further to the left. Rini *et al.* [1993]
- 50.1: Epitope defined by peptide reactivity and changes affinity with amino acid substitutions – epitope RIHIGP. White-Scharf *et al.* [1993]
- 50.1: Called R/V3-50.1 – potent neutralizing of lab strains. D'Souza *et al.* [1991]

- Progesterone-treated BALB/c mice were intravaginally infected with recombinant influenza A virus (Flu/P18IIIB), expressing the immunodominant CTL epitope (P18IIIB, RIRPGRAFVTIGK, H-2Dd). A second immunization administered 2 weeks after the first doubled serum IgG levels and enabled detection of vaginal IgG. Low levels of vaginal IgA were detected in some animals. Garulli *et al.* [2004] (**mucosal immunity**)

Research Contact Tanox Biosystems Inc and David Ho, ADARC, NY
References Gauduin *et al.* 1998; Parren *et al.* 1998a; Andrus *et al.* 1998; Poignard *et al.* 1996a; Sattentau & Moore 1995; Gauduin *et al.* 1995; Pirofski *et al.* 1993; Thali *et al.* 1993; Safrit *et al.* 1993; Moore & Ho 1993; Fung *et al.* 1990; Liou *et al.* 1989; Fung *et al.* 1987

- BAT123: Post-exposure prophylaxis was effective when MAb 694/98-D was delivered 15 min post-exposure to HIV-1 LAI in hu-PBL-SCID mice, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect delivered 4 hours post infection. Andrus *et al.* [1998]
- BAT123: Post-exposure passive transfer of murine BAT123 can confer protection to hu-PBL-SCID mice challenged with HIV-1 LAI – this protection is not elicited by CGP 47 439, a BAT123 chimera that has a human IgG1 Fc domain, suggesting that the protection is mediated by complement – the protective ability of BAT123 is lost when mice were treated with cobra venom factor, which inactivates serum complement – IgG1 does not fix complement efficiently so an IgG2 MAb might perform better. Gauduin *et al.* [1998]
- BAT123: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- BAT123: Epitope described as RGPGRAFVTIGK – V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus (BAT123 less so

B Cell

than the others), mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. Poignard *et al.* [1996a]

- BAT123: Passive transfer of BAT123 to hu-PBL-SCID mice 1 hour prior to inoculation with HIV-1 LAI, or up to four hours post-exposure, could protect mice from infection – the protection, like the MAb, was specific for the viral strain LAI. Gauduin *et al.* [1995]
- BAT123: Binds with high affinity to monomer and oligomer, rapid association and potent neutralization of lab strain. Sattentau & Moore [1995]
- BAT123: Called BAT-123 – conformational, does not bind well to denatured gp120 – not reactive with SF-2 gp120 – does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993]
- BAT123: Variable region sequenced – heavy chain: V 3660-SB32, D unknown, J H3 – light chain: V kappa21, J kappa2. Pirofski *et al.* [1993]
- BAT123: Passive transfer to Hu-PBS-SCID mice confers protection against challenge with homologous cell-free virus. Safrit *et al.* [1993]
- BAT123: Anti-idiotypic MAb, AB19-4i, stimulates anti-anti-ID which neutralizes MN and IIIB. Fung *et al.* [1990]
- BAT123: CGP 47 439 is a BAT123 chimera that has a human IgG1 Fc domain. Liou *et al.* [1989]

Keywords antibody binding site definition and exposure, antibody generation, review, subtype comparisons, variant cross-recognition or cross-neutralization

- 838-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**)
- 838-D: Called 838: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 838-D: Called 838 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 838-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 838-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 838-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 838-D showed intermediate reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 838-D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed strong binding to many A, B, C and F peptides, poor binding to D and E. Zolla-Pazner *et al.* [1999a] (**review**, **subtype comparisons**)
- 838-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 838-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 838-D bound B clade virions but had limited cross-reactivity with other clades, with low levels of binding to A and D virions. Nyambi *et al.* [1998] (**subtype comparisons**)
- 838-D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – 838-D was cross-reactive with V3 peptides from clade A and C, and could bind to 5/8 B clade V3 peptides – 50% neutralization of RF was obtained. Gorny *et al.* [1997] (**antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

B Cell

- 838-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. - 1006-15D: The neutralization potency of this Ab against 7 HIV-1 primary isolates was compared to the neutralization potency of the Ab KD-247. The same Ab concentrations were needed for neutralization of the N-NIID and 92TH022 isolates, while higher concentrations of 1006-15D were needed for the neutralization of the rest of the HIV-1 isolates suggesting 1006-15D has lower neutralization potency. Eda *et al.* [2006b] (**variant cross-recognition or cross-neutralization**)
- 1006-15D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1006-15D: Called 1006-15: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 1006-15D: Called 1006 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. Keywords antibody binding site definition and exposure, antibody generation, review, subtype comparisons

- 1027-15D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 1027-15S: Called 1027-15: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 1027-15D: Called 1027-D – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure**)
- 1027-15D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 1027-15D showed strong cross-reactivity. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1027-15D: Review of clade specificity and anti-V3 HIV-1-Abs – this Ab showed moderate binding to several B and F peptides, one C peptide, and was not reactivity with A, D and E peptides. Zolla-Pazner *et al.* [1999a] (**review**, **subtype comparisons**)
- 1027-15D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 838, 782, 1027, 908, and 1006, all selected with RF V3 peptide – the core amino acids KSITK tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 1027-15D: Five human MAbs against were derived from HIV-infected North American subjects after selection by the V3 RF peptide – 1027-15D was not cross-reactive with V3 peptides from clade A or E, but could bind to 3/8 B clade V3 peptides, and 1/2 C clade V3 peptides. Gorny *et al.* [1997] (**antibody binding site definition and exposure**, **antibody generation**, **subtype comparisons**)

- V3-13: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. In addition, V3-13 inhibited transmission of CCR5-tropic viruses while transmission of V3-13-neutralized X4 variants increased, indicating that X4 HIV-1 has an advantage over R5 in transmission when neutralized with V3-13. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)

- 13105100: This MAb was raised against the peptide IRIQRGPGRAFVTI, located within the V3 loop flanking the GPGR apical motif. Two MAbs were used to determine the photodamage location in HIV-1 Env induced by sulfonated anionic porphyrins. The negatively charged porphyrins interact with positive charge in the V3 loop. When light activated, they damage amino acid side chains in the C5 region of Env, as evidenced by inhibition of binding of C5 MAb 9201, but not V3 MAb 13105100. Anionic porphyrins could be used in targeted photodynamic decontamination of biological fluids, such as blood, killing HIV without disabling the function of desirable transfusion products. - M77: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. M77 neutralizes some TCLA strains. Gorny & Zolla-Pazner [2004] (**review**)
- M77: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. Cluster I and II MAbs bound to gp120/gp41 complexes at the cell-to-cell contact interface, in contrast to M77 which bound to gp120 that was evenly dispersed over the target cell surface. Finnegan *et al.* [2002]
- M77: M77 is highly strain specific for IIIB, but anti-idiotypic Abs directed against M77 can in turn elicit an Ab response with expanded HIV cross-reactivity – this mechanism may serve to prolong the primary response and to counter-balance viral immune evasion by mutation. Denisova *et al.* [2000] (**variant cross-recognition or cross-neutralization**)
- M77: Used M77 bound to gp120 as an immunogen – analysis of polyclonal and monoclonal (62 MAbs were generated) response suggests the M77-gp120 immunogen generated MAbs to more linear epitopes than gp120 alone or gp120 bound to CD4. Denisova *et al.* [1996] (**vaccine-specific epitope characteristics**)
- M77: Native M77 is highly strain specific, and V3 binding is primarily dependent on its heavy chain – a light chain switched Fab version of M77 could recognize HIV-1 strains that had substitutions on the left side of the V3 loop – R in GPGR is likely to be critical for binding. Watkins *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- M77: Reacted with both reduced and non-reduced covalently cross-linked gp120-CD4 complex. DeVico *et al.* [1995] (**antibody binding site definition and exposure**)
- M77: Conformational rearrangements upon binding of M77 to gp120 generates novel epitopes called metatopes. Denisova *et al.* [1995]
- M77: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. Cook *et al.* [1994]
- M77: Stated to be a murine MAb – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – M77 neutralization was only slightly reduced by this mutation. Watkins *et al.* [1993] (**escape**)
- M77: Antibody binding to viral isolates from IIIB infected lab worker followed through time – A to T substitution resulted in the loss of neutralization and native gp120 binding, but not peptide binding. di Marzo Veronese *et al.* [1993] (**escape**)
- M77: IIIB-specific MAb, immunoprecipitates deglycosylated form. di Marzo Veronese *et al.* [1992] (**variant cross-recognition or cross-neutralization**)

- loop 2 database comment: Also known as Loop 2, IgG1 Loop 2 was a obtained by engineering Fab loop2 into an IgG1 molecule. (**antibody generation**)
- loop 2: Called loop2. This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. loop 2 neutralizes some TCLA strains. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**)
- loop 2: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- loop 2: Called loop2. scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that

B Cell

the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

- loop 2: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope – binding affinity of divalent IgG1 loop 2 is only 2-fold greater than monovalent Fab loop 2, suggesting the IgG1 form may bind with only one arm. Parren *et al.* [1998a] (**binding affinity**)
- loop 2: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – loop 2 enhances YU2 at concentrations up to 20 ug/ml. Sullivan *et al.* [1998a]
- loop 2: Binds to gp120 from MN and SF2 but not LAI. Ditzel *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- loop 2: Epitope is suggested to be GPGRAF – binds to 10/17 US clade B monomeric gp120s – IgG1 form can neutralize MN and 2 primary isolates tested. Parren & Burton [1997]
- loop 2: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- loop 2: Viral binding inhibition by loop 2 MAb or Fab was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997]
- loop 2: MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 – binding of loop 2 blocks this inhibition. Wu *et al.* [1996] (**co-receptor**)
- loop 2: Called Loop 2 – shows modest cross-reactivity among B clade gp120s, little outside B clade. Moore *et al.* [1994b] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- loop 2: Sequences of the heavy and light chain Fab variable regions were generated. Barbas III *et al.* [1993] (**antibody sequence variable domain**)

- MN215: MRC Centralized Facility for AIDS Reagents, NIBSC, UK, EVA3056
- MN215: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Binding of MN215 to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **binding affinity**)
- MN215: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- MN215: HIV-1 fusion complexes were prepared from cell lines expressing R5 HIV-1 gp120/gp41 and CD4-CCR5. Neutralizing Abs were raised against both R5 (strain BaL) and X4 (strain 213) viruses. MN215 was used to detect gp120/gp41. Zipeto *et al.* [2005] (**vaccine antigen design**)
- MN215: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. MN215 neutralizes some TCLA strains. Gorny & Zolla-Pazner [2004] (**review**)
- MN215: Minimum epitope for MAB using the Dutch consensus is AFYTTGE, different than defined for MN – generated by EBV transformation of PBMC – displayed higher affinity for NSI than for SI glycoproteins – amino acids HIGP were essential for binding. Schutten *et al.* [1995b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

- 4117C: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, a great reduction in sensitivity to neutralization was observed in the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1 and H) except subtypes C, CRF01_AE and CRF02_AG. This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4117c: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from subtype B infected individuals reacted only with subtype B. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. Neutralization by anti-V3 B clade specific MAbs 447-52D and 4117C was fully blocked by a clade V3 loop fusion protein, but not an A clade fusion protein, while Cameroonian sera neutralization was fully blocked by both A and B clade fusion proteins. Krachmarov *et al.* [2005] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4117c: This study is about the MAb C108g, and 4117C was a control. 4117C is a linear V3 epitope unaffected by reduction, whereas C108g, contrary to earlier reports, requires disulfide bonds. C108G is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MABs 4117c, 2219, 2191, and 447-52D,

B Cell

but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Binding to CCR5 was completely inhibited by two V3 MAbs, 4117C and 2219, and was substantially inhibited by 2G12, but was not inhibited by C108g. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)

- 4117c: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. 4117C and 4118D are anti-V3 MAbs that neutralize TCLA strains. Gorny & Zolla-Pazner [2004] (**review**)
- 4117c: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12 which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 5/6 anti-V3 MAbs, including 4117c, had similar binding affinity to soluble SF162 and JR-FL rgp120s, although the V3 loop differs at three positions (HigpgrafyTtgE for JR-FL and TigpgrafyAtgD for SF162). Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 4117C: Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 4117C: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – bound and directed lysis against MN and SF2, but not IIIB and RF. Alsmadi & Tilley [1998] (**ADCC**, **variant cross-recognition or cross-neutralization**)
- 4117C: Neutralizes SF2 and MN synergistically combined with anti-CD4 binding site discontinuous MAb. Pinter *et al.* [1993a]; Tilley *et al.* [1992] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 4117C: Binds V3 loop – does not immunoprecipitate soluble gp120, does react with gp120 on intact virions. Pinter *et al.* [1993b] (**antibody binding site definition and exposure**)
- 4117C: Potent neutralizing activity against MN, SF-2, and NY-5 – synergy with CD4BS MAb 1125H. Tilley *et al.* [1991a] (**antibody binding site definition and exposure**, **antibody interactions**, **variant cross-recognition or cross-neutralization**)

- 419-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 419-D: Called 419: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**mimotopes**, **superinfection**)
- 419-D: Called 419 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 419-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 419-D showed intermediate reactivity, and no neutralization when tested against five strains – discrepancy between the epitope as described in earlier papers and as described here, KRIHIGP. Nyambi *et al.* [2000] (**subtype comparisons**)
- 419-D: Review of clade specificity and anti-V3 HIV-1-Abs – epitope is described as KRIHIGP. Zolla-Pazner *et al.* [1999a] (**antibody binding site definition and exposure**, **review**)
- 419-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**)
- 419-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 419-D bound to 3/4 B clade virions, and to D clade MAL. Nyambi *et al.* [1998] (**subtype comparisons**)
- 419-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera

B Cell

and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)

- 419-D: Neutralizes MN – binds SF2: IYIGPGR. Gorny *et al.* [1993] (**variant cross-recognition or cross-neutralization**)
- 419-D: Mediated deposition of complement component C3 on HIV infected cells, enhanced by second Ab binding, rabbit anti-human IgG. Spear *et al.* [1993] (**complement**)
- 419-D: MN, NY5 and SF2 strain specific, does not cross-react with RF, CDC4, WM52 or HXB2. Karwowska *et al.* [1992b] (**variant cross-recognition or cross-neutralization**)

Keywords antibody binding site definition and exposure, review, structure

- 83.1: Angle of interaction between 83.1 and V3 was shown by superimposing the Fab fragment of the Ab with V3. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- 83.1: Data is summarized on the X-ray crystal structures resolution and NMR studies of 83.1. Sirois *et al.* [2007] (**review**, **structure**)
- 83.1: The crystal structure of V3-reactive antibody-peptide complexes were examined. 83.1 completely surrounded V3, suggesting a high degree of accessibility for generating an immune response. Accessibility of V3 to this MAb is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- 83.1: This review summarizes data on crystallographic structures of 83.1 binding to its V3 peptide antigens. Conformation of the V3 peptide bound to 83.1 is very similar to its conformation when bound to 447-52D. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 83.1: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999]
- 83.1: Maternally transferred anti-V3 loop MAb selectively inhibits the anti-V3 loop Ab component of the IgG response to rgp120 SF2 in 21 day old BALBc mice. Jelonek *et al.* [1999]
- 83.1: 19 day old mice injected with 83.1 have a shift in IgG1 response away from the V3 loop upon vaccination, without decreasing the total IgG anti-gp120 response, suggesting that prior treatment with a MAb can mask immunogenic sites and shift the immune response to vaccination. Keller & Arora [1999]
- 83.1: Study of synergism of neutralization and binding comparing F105 and sCD4 with the V3 MAbs: 50.1, 59.1, 83.1, and 58.2 – synergy was observed, and the data suggest that binding of one ligand (F105) can increase the binding of the second (e. g. V3 loop MAbs) due to conformational changes. Potts *et al.* [1993]
- 83.1: Neutralizes SF2. White-Scharf *et al.* [1993]

B Cell

- F58/D1: Called F58. A 17 amino acid peptide from the CDR-H3 region of F58 retained specificity for gp120 and could neutralize IIIB, although less efficiently than the intact antibody. The F58 MicroAb has a 3-fold faster association rate and a 37.5-fold more rapid dissociation rate than the intact antibody. Such Ab binding site fragments, that retain binding specificity, are called microantibodies. Alanine-substitutions in F58 MicroAb at three positions significantly compromised neutralization but did not reduce binding to soluble gp120, while substitutions at three other positions abrogated both binding and neutralization. The microAb forms a conformationally constrained beta sheet. Heap *et al.* [2005b] (**antibody binding site definition and exposure**, **antibody sequence variable domain**, **structure**)
- F58/D1: A 17 amino acid MicroAB was made from the third complementarity-determining region of the heavy chain of MAb – F58 neutralized 5x's more efficiently in terms of mass than the original MAb, 32-fold less on a molar basis – neutralization does not involve initial attachment, but fusion and events in early infection. Jackson *et al.* [1999]
- F58/D1: The interaction of a 17-amino-acid neutralizing microantibody (MicroAB) based on F58 and HIV-1 env was studied by electrospray ionization mass spectrometry. Millar *et al.* [1998]
- F58/D1: Called F58. The complementarity-determining region of F58 was used to create a miniantibody that could neutralize both HIV-1 IIIB and SF2 in vitro. Levi *et al.* [1993] (**antibody binding site definition and exposure**, **antibody sequence variable domain**)

- IIIB-13 V3: NIH AIDS Research and Reference Reagent Program: 1727.

B Cell

- IIIB-V3 13: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- IIIB-13 V3: Called 1727: Used as a standard for comparing immune responses to modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation – experiment showed enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. Chakrabarti *et al.* [2002]
- IIIB-13 V3: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- IIIB-13 V3: Included in a panel of antibodies used in a multilab study for antibody characterization and assay comparison, some neutralization of strains other than IIIB. D'Souza *et al.* [1994]
- IIIB-13 V3: Called IIIB-V3-13 – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – IIIB-V3-13 neutralization was only slightly reduced by this mutation. Watkins *et al.* [1993]
- IIIB-13 V3: Neutralizes IIIB but not MN. Laman *et al.* [1992]

- µ5.5: This Ab was shown not to neutralize HIV-1 MNp in spite of the fact that HIV-1 MNp V3 tip sequence is identical to the V3 sequence of this Ab's epitope, suggesting that the neutralization epitope of HIV-1 MNp may be narrower than that of the V3 epitope of Rµ5.5. Rµ5.5 also did not neutralize HIV-1 AD8, SHIV 89.6 and SHIV C2/1. The affinity of this Ab was tested for HIV-1 MN. Eda *et al.* [2006b] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**)
- Rµ5.5: This MAb was used as a positive control in KD-247 studies. HIV-1 plasma and PBMC clone sequences from two patients were used for prediction of the effect of KD-247 against patient's primary isolates. In patient 1 all clones matched epitope sequence recognized by KD-247 while 5 out of 7 plasma, and 2 out of 22 PBMC sequences matched the sequence recognized by Rµ5.5. In the second patient only a small portion of the quasi-species was recognized by Rµ5.5. Matsushita *et al.* [2005] (**antibody binding site definition and exposure**)
- µ5.5: Rµ5.5 is a humanized antibody of mouse MAb m5.5 – neutralized primary isolates with similar V3 loops – passive transfer of MAb to SCID-hu or hu-PBL-SCID mice conferred protection. Okamoto *et al.* [1998]
- mu5.5: sCD4 causes loss of IIIB type-specificity for MAb 0.5beta, allowing binding and neutralization of MN, in contrast to MAb µ5.5. Maeda *et al.* [1992]

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, neutralization, review, structure, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- 19b: Similarity level of the 19b binding site pentapeptide -I—-G–FY-T to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 4 times, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 19b: 19b neutralized two of the 15 subtype B isolates tested, 5768-p27 and 92BR020c. Binding affinity of MAb 19b to gp120 was strongly reduced (>10-fold) upon substitutions of Arg304, Ile307, Pro313, Arg315, Phe317, or Tyr318 to Ala. The affinity was moderately reduced (∼4-fold) upon substitution of Lys305. Thr320 was not important for 19b binding. Substituting Asp325 with Ala increased the binding affinity of 19b by 2-fold, suggesting that Ala at this position prevents formation of a salt bridge thus allowing for a better presentation of 19b epitope. 19b neutralized 5768-p27 more potently than 92BR020c although the viruses have same V3 residues important for 19b binding. 5768-p27 has a Met at position 309 and 92BR020c has Ile, indicating that 19b requires an aliphatic side chain at position 309. The inability of 19b to neutralize 6 of the 15 viruses tested could be explained by substitutions at important contact residues, while its inability to neutralize the remaining 6 viruses could not be explained by this. The fine specificity of 19b was mapped onto V3 in the structural

B Cell

context of gp120. Binding site was formed by Arg304 in the N-terminal V3 stem, and Arg315, Phe317, and Tyr318 were in the C-terminal half of the V3 tip. The presence of Pro313 and Arg315 is required to form the V3 tip hairpin turn and juxtapose the true contact residues. Thus, 19b may need to interact with V3 from an angle, which does not permit access to V3 on many different primary viruses. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **structure**)

- 19b: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. 19b belonged to the group 1 MAbs, which are able to bind both subtype B and C gp120 proteins and peptides. 19b bound to B gp120 and C gp120 with low avidity. Furthermore, 19b was able to bind both subtype C V3 in the subtype B Env backbone chimera, and reverse, indicating that 19b binds to V3 in a way that is not affected by the gp120 backbone. For subtype B, changes in the position 13 (H13R) and/or position 18 (R18Q) showed no difference of 19b binding compared to wildtype. For subtype C, H13 residue enhanced binding of 19b, but the R18 mutation reduced binding, indicating that R18 affects the conformation of V3 subtype C. Although 19b bound to JR-FL V3, this isolate was resistant to neutralization by 19b, as was SF162. However, a chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by 19b, suggesting an important role of one or more of the three V3 amino acids that differ between these two isolates in defining the epitope and/or structure of the protein. Patel *et al.* [2008] (**neutralization**, **binding affinity**, **subtype comparisons**)
- 19b: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to 19b and other MAbs. Gao *et al.* [2007] (**antibody binding site definition and exposure**, **review**)
- 19b: This review summarizes 19b Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- 19b: This Ab was used in the analysis of clade C gp140 (97CN54) antigenicity and was shown to bind with relatively high avidity. Sheppard *et al.* [2007b] (**variant cross-recognition or cross-neutralization**)
- 19b: This Ab was shown to infrequently neutralize cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors with and without broadly cross-reactive neutralizing antibodies. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 19b: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. 19b was shown to bind specifically to all the recombinant proteins as well as to the gp120 from two subtype B isolates. The specific binding of his Ab to CON-S indicated that its conformational epitope was intact. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- 19b: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **review**)
- 19b: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V3 MAbs (447-52D, 19b, F245-B4e8 and 39F) bound to the GDMR antigen, but either did not bind or had diminished binding to mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 19b: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**neutralization**, **variant cross-recognition or cross-neutralization**, **review**, **subtype comparisons**)
- 19b: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 19b: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 19b: Virion capture assays are not a good predictor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – while b12 was potent at neutralizing the three primary virions JR-CSF, A DA, and 89.6, the Abs F105, 19b, and Fab b6 were overall very poor neutralizers. Poignard *et al.* [2003]
- 19b: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4)

B Cell

region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

- 19b: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- 19b: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. Schulke *et al.* [2002]
- 19b: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 19b: Mutations in two glycosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to 19b. Kolchinsky *et al.* [2001]
- 19b: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form but 19b was an exception and required around 950 ng/ml to neutralize either form. Park *et al.* [2000]
- 19b: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999]
- 19b: Used as a control in this Hx10 binding and neutralizing MAb study because 19b does not bind to Hx10. Mondor *et al.* [1998]
- 19b: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- 19b: No detectable neutralizing activity among primary isolates with different co-receptor usage – some neutralization of TCLA strains. Trkola *et al.* [1998]
- 19b: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 19b has an epitope involving the tip of the V3 loop, with 5 or 6 essential amino acids distributed within a 12 amino acid stretch – the previously determined binding site was confirmed -I—-G–FY-T and some tolerated variants described, the I can be I, V, or L, the Y can be Y, F, or W – probably a beta-turn is required for FY or FF binding, but WY in can bind with out the context of the turn. Boots *et al.* [1997]
- 19b: In a multilaboratory blinded study, failed to consistently neutralize any of nine B clade primary isolates – there were four sequences with variations in the defined epitope among the 9 isolates tested. D'Souza *et al.* [1997]
- 19b: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 19b bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997]
- 19b: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b]
- 19b: Viral binding inhibition by 19b was weakly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997]
- 19b: Not as effective as IgG1b12 at neutralization *ex vivo* of virus direct from plasma of HIV-1 infected individuals. Gauduin *et al.* [1996]

B Cell

- 19b: Inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- 19b: MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 – binding of 19b blocks this inhibition. Wu *et al.* [1996]
- 19b: Binds to some gp120s from clades A,B,C,E, and F – weakly neutralized some B and one C clade virus. Moore *et al.* [1995b]
- 19b: Despite broad gp120 binding reactivity, not broadly neutralizing. Moore *et al.* [1995a]
- 19b: Review: more broadly cross-reactive than anti-V3 tip MAb 447-D. Moore & Ho [1995]
- 19b: Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. Sattentau *et al.* [1995]
- 19b: V3 loop binding MAb that is more broadly clade cross-reactive than most (binds to 19/29 clade B and 10/12 clade E gp120s) Moore *et al.* [1994b]
- 19b: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. Moore *et al.* [1994a]

Keywords antibody binding site definition and exposure, binding affinity, dendritic cells, neutralization, review, subtype comparisons

- 268-D: UK Medical Research Council AIDS reagent: ARP3024.
- 268-D: NIH AIDS Research and Reference Reagent Program: 1511.
- 268-DI V: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. 268-DI V belonged to the group 3 MAbs, which are able to bind subtype B but not subtype C gp120 and V3 peptide. 268-DI V was able to bind subtype B V3 in the subtype C Env backbone chimera, but not the reverse, indicating that 268-DI V binds to a structure created by the subtype B V3 sequence that is not impacted by the gp120 backbone. For both subtypes B and C, 268-DI V required H13 and R18 residues in order to bind, indicating that these residues likely define key aspects of the Ab epitope. 268-DI V was not able to neutralize JR-FL or SF162 isolates, but a chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. Patel *et al.* [2008] (**neutralization**, **binding affinity**, **subtype comparisons**)
- 268-D IV: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 268-D: The epitope for the MAb D19 is conserved and embedded in V3. D19 is unique in that for R5 viruses, it was cryptic and did not bind without exposure to sCD4, and for X4 and R5X4 isolates it was constitutively exposed. It had an overlapping binding region with MAbs 447-52D, B4e8, and 268-D, but different reactivity patterns and fine specificity. Lusso *et al.* [2005]
- 268-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, while many neutralize some TCLA strains, a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 268-D: Called 268: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4 induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides do not show as much ability to neutralize as V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 268 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 268-D: Called ARP3024: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. Vella *et al.* [2002]
- 268-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera—2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5—thus multiple epi-

topes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]

- 268-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding – one of the TCLA V3 viruses 320SI-C3.3 shows reduced binding with this MAb, the sequence of the epitope in 320SI is HIGPGR and in 320SI-C3.3 is RIGPGR. York *et al.* [2001]
- 268-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V3 MAbs 447-52-D and 268-10-D did not effect proliferation. Hioe *et al.* [2000]
- 268-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 268-D showed weak reactivity. Nyambi *et al.* [2000]
- 268-D: Called 268D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
- 268-D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 268-D bound rgp120 W61D but could only neutralize the W61D isolate following T-cell line adaptation. Beddows *et al.* [1999]
- 268-D: Called MAb 268 – To identify potential mimotopes of V3, a hexapeptide phage library was screened with MAb 268 – two hexamers were identified, HLGPGR or KAIHRI that bind to 268 with the same binding site as the V3 loop and inhibit 268 MN gp120 – KLH conjugated hexamer KAIHRI stimulates Abs in rabbits that cross-react with ML gp120. Laisney & Strosberg [1999]
- 268-D: Called 268-11D – Study of a live-vector mucosal vaccine that expresses HIV-1 V3 domains using the bacterium Streptococcus gordonii which can express heterologous Ag and can colonize the oral cavity and vagina of mice – 268-D and 257-D recognized S. gordonii expressing the V3 domain of MN – the vaccine stimulated V3-specific IgG2a in mice. Oggioni *et al.* [1999]
- 268-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a]
- 268-D: Peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group – MAb 453, with an identical core epitope to 268 based on prior experiments (HIGPGR), was not part of this reactivity group, illustrating that context can be critical. Zolla-Pazner *et al.* [1999b]
- 268-D: A T-cell line-adapted (TCLA) derivative of SI primary isolate 168P acquired the ability to be neutralized by anti-V3 MAbs – the primary isolate could use either CCR5 or CXCR4, and was not neutralized when infection was directed via either pathway, however the TCLA derivative uses CXCR4 only and is neutralized. LaCasse *et al.* [1998]
- 268-D: Poor reactivity against HIV-1 isolates SF162 and SF128A and no neutralization, in contrast to MAbs 391/95-D and 257-D. Stamatatos *et al.* [1997]
- 268-D: Failed to neutralize HXB2 and chimeric virus with gp120 from primary isolates in an HXB2 background. McKeating *et al.* [1996]
- 268-D: 268-D is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996]
- 268-D: The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – V3 loop epitopes were less accessible to Ab binding on the virion surface than in the gp120 monomer, particularly for macrophage-tropic isolates SF162 and SF128a, relative to T-cell tropic SF2 – sCD4 association with gp120 did not influence the binding of 268-D to virion-associated gp120, although sCD4 binding did alter epitope exposure for other anti-V3 MAbs. Stamatatos & Cheng-Mayer [1995]
- 268-D: Serotyping study using flow-cytometry, if H of HIGPGR was substituted in virus, 268-D did not bind. Zolla-Pazner *et al.* [1995]
- 268-D: Moderate dissociation rate and homologous neutralization titer. VanCott *et al.* [1994]
- 268-D: Neutralizes MN – binds SF2: YIGPGR – specificity: MN, SF2, NY5, RF, CDC4. Gorny *et al.* [1993]
- 268-D: Mediated deposition of complement component C3 on HIV infected cells, but not in the presence of sCD4. Spear *et al.* [1993]
- 268-D: Reacts with MN, NY5, CDC4, RF and SF2, does not cross-react with WM52 or HXB2. Karwowska *et al.* [1992b]
- 268-D: Called 268-11-D-IV – strain specific weakly neutralizing. D'Souza *et al.* [1991]

- 418-D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 418-D: Called 418: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. 418 was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 418-D: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]

- 110.5: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- 110.5: Viral binding inhibition by 110.5 was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997]
- 110.5: Deletion of the V1V2 regions did not affect anti-V3 Abs ability to bind when compared to intact rec gp120. Jeffs *et al.* [1996]
- 110.5: Neutralizes HIV-1 LAI. McDougal *et al.* [1996]
- 110.5: Reciprocal binding inhibition with other anti-V3 MAbs – enhances binding of some anti-V2 MAbs – binding enhanced by some CD4 binding site MAbs. Moore & Sodroski [1996]
- 110.5: Did not induce dissociation of gp120, as sCD4 did – discrepancy with Poignard *et al.* [1996a], that was suggested to be due to MAb interference with detection, as the gp120-MAb complex was denatured in the Poignard study Moore *et al.* [1990]. Moore *et al.* [1990]; Poignard *et al.* [1996a]
- 110.5: V3 MAbs 9284, BAT123, 110.5, and 110.I could each significantly increase gp120 dissociation from virus, mimicking sCD4, and expose the gp41 epitope for MAb 50-69, in contrast to anti-V2 MAbs. Poignard *et al.* [1996a]
- 110.5: Pretreatment of HX10-infected H9 cells with sCD4 decreases signal from 110.5 at 37 degrees due to dissociation of gp120-gp41. Sattentau *et al.* [1995]
- 110.5: Binds with high affinity to monomer and oligomer, rapid association and potent neutralization of lab strains – neutralizes cell-free Hx10. Sattentau & Moore [1995]
- 110.5: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to conformationally sensitive neutralizing MAbs – neutralization efficiency of 110.5 is not affected. Klasse *et al.* [1993a]; Reitz *et al.* [1988]
- 110.5: Thrombin cleavage of V3 loop between R-315 and A-316 abrogates binding – can inhibit C4 region antibody which has conformational requirements (G3-299) – binding to native gp120 100-300 fold greater than to denatured. Moore *et al.* [1993b]
- 110.5: Variable region sequenced – heavy chain: V 3660-SB32, D closest to DSP2.3, 2.4 and .6, J H2 – light chain: V kappa21, J kappa2. Pirofski *et al.* [1993]
- 110.5: Binding insensitive to gp120 reduction. Cordell *et al.* [1991]
- 110.5: Two fold increase in binding to gp120 in the presence of bound sCD4. Sattentau & Moore [1991]

Keywords antibody binding site definition and exposure, neutralization, review, structure, subtype comparisons, variant cross-recognition or cross-neutralization

- 58.2: 58.2 neutralized 5 of the 15 subtype B isolates tested, of which 4 were resistant to neutralization by MAbs 19b, 39F, CO11, F2A3, F530, LA21 and LE311. Angle of interaction between 58.2 and V3 was shown by superimposing the Fab fragment of the Ab with V3. 58.2 was shown to interact with V3 from a nearly identical angle as MAb 447D. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **structure**)
- 58.2: Data is summarized on the X-ray crystal structures resolution and NMR studies of 58.2. Sirois *et al.* [2007] (**review**, **structure**)
- 58.2: The crystal structure of V3-reactive antibody-peptide complexes were examined. 58.2 completely surrounded V3, suggesting a high degree of accessibility for generating an immune response. Accessibility of V3 to this MAb is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- 58.2: This review summarizes data on crystallographic structures of 58.2 binding to its V3 peptide antigens. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 58.2: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. 58.2 could only neutralize B subtype viruses, and seemed to have a minimal epitope of (H/T)IGPGR(A/T)(F/L). Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 58.2: 58.2's epitope was noted to be IGPGRAF – Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001]
- 58.2: The crystal structure of Fab 58.2 bound to V3 loop peptides was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different MAbs were bound – 58.2's epitope was defined as KRKRIHIGPGRAFY. Stanfield *et al.* [1999]
- 58.2: Competition ELISAs with serial deletions produced longer estimates of epitope length, RIHIGPGRAFY, than Alanine substitution, suggesting significance of non-contact residues. Seligman *et al.* [1996]
- 58.2: Modest cross-reactivity among B clade gp120s, little outside B clade – core epitope as I-IHIG. Moore *et al.* [1994b]
- 58.2: Did not synergistically neutralize MN in combination with MAb F105 – there was synergistic neutralization when combined with sCD4. Potts *et al.* [1993]
- 58.2: Epitope defined by peptide reactivity and changes in affinity with amino acid substitutions – 4/7 primarily isolates were neutralized. White-Scharf *et al.* [1993]

Species (Isotype) mouse (IgA, IgG1, IgG2a)
References Golding *et al.* 2002a

- Internasal (i.n.) immunization with V3-Ba induced mucosal anti-V3 NAbs and IFN-gamma secreting T cells – V3-Ba, V3-KLH and V3-LPS could each induce serum and mucosal IgA and IgG in BALB/c mice – i.n. plus i.p. immunizations gave higher titers than i.n. alone – the response to V3-KLH was mainly restricted to IgG1, and to V3-Ba, IgG2a – class II KO mice (CD4+-deficient) did not respond to V3-KLH, but did respond to V3-Ba, suggesting that V3-Ba may be effective in eliciting Ab responses in HIV-1 infected individuals that have impaired CD4+ T cell function. Golding *et al.* [2002a]

B Cell

- KD-247: Escape variants were induced by exposing the HIV-1 strain MOKW to different concentrations of KD-247 in vitro. In the presence of relatively low concentrations of the Ab, viral variants with V2 mutations R166K and D167N were found with partial resistance against KD-247. In the presence of high concentrations of KD-247, in addition to the V2 mutations, a V3 tip mutation (P313L) induced complete resistance to KD-247. V2 P175L substitution conferred high resistance to KD-247, however, additional KN susbstitutions in positions 166 and 167 resulted in a less resistant virus with a replication advantage. Shibata *et al.* [2007] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **escape**, **binding affinity**)
- KD-247: A new humanize MAb recognizing the V3 tip sequence was generated by transferring the genes of the complementary determining region of the mouse NAb C25 into genes of a human V region. C25 was raised by serial vaccinations of a mouse with distinctive six B clade V3 loop peptides. KD-247 was shown to neutralize laboratory and primary isolates of CXCR4 and CCR5 viruses that possess a GPGR sequence in the Env V3 tip region more effectively than any of the reference Abs used in the study. KD-247 was shown to recognize the narrow V3 tip sequence with high affinity. Eda *et al.* [2006b] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **antibody sequence variable domain**)
- KD-247: This Ab was shown to efficiently neutralize clade B and B' CXCR4 and CCR5 HIV-1 primary isolates with matching V3 sequence motifs while it did not neutralize sequence-mismatched clade B and E isolates. It was also shown to provide sterile protection against SHIV challenge when passively transfered to monkeys in a single high dose. Lower doses provided partial protection. Eda *et al.* [2006a] (**immunoprophylaxis**, **variant cross-recognition or cross-neutralization**)
- KD-247: An escape variant highly resistant to KD-247 was induced with a mutation G314E in the V3 tip of gp120. This mutant virus was shown to be sensitive to CCR5 inhibitors, RANTES, rsCD4 and an anti-CCR5 MAb, but resistant to an anti-CD4 MAb. Combinations of this Ab and CCR5 inhibitors were found to be highly synergistic. Yoshimura *et al.* [2006] (**escape**)
- KD-247: The epitope recognized by this MAb was mapped to IGPGRA. The arginine (R) could not be replaced by any other amino acid, while the amino acids in the flanking sequence, IG, could be substituted without loss of KD-247 binding. The neutralizing sensitivity of clade B SF162, 89.6 and JR-FL to this Ab varied although they share the IGPGRA sequence. At high concentrations, KD-247 was able to suppress replication of viruses derived from patients. At lower concentrations of the MAb, viral replication continued and neutralization escape variants emerged. The escaped viruses had either igpgGa or igpgSa sequences at the tip of the V3 loop. Matsushita *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**, **escape**)

- 537-D: Similarity level of the 537-D binding site pentapeptide IGPGR to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 0 times, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 537-D: Called 537: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 537-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 537-D showed weak reactivity. Nyambi *et al.* [2000]
- 537-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a]
- 537-D: MAb peptide-reactivity pattern clustered with immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b]

Keywords co-receptor, HAART, ART

- RC25: MD14 is a R5X4 SHIV with a B clade Env; the V3 loop of an E-clade Env was inserted into MD14 to create SHIV-TH09V3, an R5 virus. SHIV-TH09V3 could infect both cynomolgous and pig-tailed macaques, and the R5 co-receptor usage was maintained after passage through macaques. The MAb RC25 recognized B clade V3 loops, and reacted with SHIV-MD14. Rabbit anti-sera raised against a NSI Clade E consensus preferentially recognized SHIV-TH09V3. Kaizu *et al.* [2003] (**co-receptor**)
- RC25: RC25 is a humanized MAb that recognizes the epitope IGPGRA – it has strong neutralizing activity against JRFL (R5 virus) and weak against NL4-3 (X4 virus) and is used as a control in a study of NAb activity in patients undergoing HAART. Kimura *et al.* [2002] (**HAART, ART**)

Keywords antibody binding site definition and exposure, escape, kinetics, neutralization, optimal epitope, variant cross-recognition or cross-neutralization

- P3E1: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. When the V1 loop of the heterologous isolates was replaced by the V1 loop present on the DF162go140 immunogen, these isolates became susceptible to neutralization by anti-V3 MAb P3E1, indicating that the V1 loop plays an important role in the resistance of heterologous viruses to neutralization. Ching *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**)
- P3E1: The minimal epitope for this Ab is most probably located within the V3 crown IGPGRAF. The presence of F and R was important for P3E1 binding. Binding did not depend on the oligomerization state of Env. P3E1 neutralized SF162 and also exhibited cross-neutralizing activity with 89.6, SS1196.1 and 6535.3. On other primary isolates, V1 loop masked the exposure of the P3E1 epitope in V3 and affected neutralization. The SF162ΔV2 virus was significantly more susceptible to neutralization by P3E1 than the wildtype virus, while ΔV1 virus was neutralized with reduced potency. Glycans at positions 154 and 195 in V1V2 enhanced P3E1 neutralizing potency. Neutralization by P3E1 was also enhanced strongly by deletion of the V3 glycan at position 299, somewhat less by deletion at position 329, and not at all by deletion of the glycan at position 293. Glycans present in the V4-V5 region had only modest effects on the neutralizing potential of this Ab, where their removal resulted in a more neutralization resistant virus. Derby *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**, **variant cross-recognition or cross-neutralization**, **kinetics**)
- P3E1: This is a new anti-V3 loop Ab isolated from mice immunized with SF162-derived gp140 proteins. Viruses from early and late infection of a macaque with SHIV SF162P4 were resistant to contemporaneous serum that had broadly reactive NAbs. SF162 was highly susceptible to neutralization by anti-V3 MAbs 447D and P3E1, as well as anti-V1 MAb P3C8, while envelopes cloned from this animal at 304 days and at 643 days (time of death) post infection had developed resistance to all three of these antibodies. Kraft *et al.* [2007] (**neutralization**, **escape**)
- P3E1: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). P3E1 recognized SF162gp140 and ΔV2gp140 equally and failed to recognize ΔV2ΔV3gp140 and ΔV3gp140. P3E1 neutralized SF162 efficiently while its neutralization potential was reduced by 93% in the presence of V3 peptides. 6% reduction in neutralization by P3E1 was observed by the presence of a scrambled V3 peptide used as a control for nonspecific binding by sera, although the scrambled peptide was not recognized by P3E1 in epitope mapping studies. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)

Ab Type gp120 V3
References Smith *et al.* 1998

- The tip of the MN V3 loop (IGPGRAFYTTKN) was inserted into cold-causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies – chimeric viruses elicited potent NAbs against ALA-1 and MN. Smith *et al.* [1998]

No. 585

- 0.5beta: UK Medical Research Council AIDS reagent: ARP3025.
- 0.5beta: NIH AIDS Research and Reference Reagent Program: 1591.
- 0.5β: Post-attachment enhancement (PAE), which augmented the level of HIV-1 cell infection by 1.4-fold, was significantly inhibited by 0.5β mAb. An increased amount of 0.5β mAb showed the same amount of inhibition of PAE, indicating that the PAE inhibition by this Ab could not solely be explained by covering of the V3 loop with Ab molecules. 0.5β mAb was also shown to suppress the fluidity of the viral and plasma envelopes. It is suggested that the binding of 0.5β to the viral surface could affect steric alternations of the viral envelope and restrain the envelope from enhancing its fluidity. Thus, suppression of the fluidity of viral envelope could be one additional mechanism for virus neutralization by 0.5β mAb. Harada *et al.* [2008] (**antibody interactions**, **enhancing activity**, **neutralization**)
- 0.5β Data is summarized on the X-ray crystal structures resolution and NMR studies of 0.5β. Sirois *et al.* [2007] (**review**, **structure**)
- 0.5beta: The affinity of this Ab was measured for three peptides, one representing the sequence of the V3 loop of HIV-1 IIIB strain and the other two having thiazolidine derivatives replacing the proline within the GPGR. None of the replacements had a large effect on binding of the Ab but the replacement with 2,2 dimehylthiazolidine behaved more like the wildtype. This and the structural and conformational studies by NMR and modeling indicate that it can successfully be used to mimic the native peptide. Garcia *et al.* [2006] (**antibody binding site definition and exposure**, **mimics**, **binding affinity**, **structure**)
- 0.5β: The nuclear magnetic resonance structure of V3-reactive antibody-peptide complexes were examined. V3 bound to 0.5β is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- 0.5β: Hybridoma cell lines from trans-chromosome knockout mice immunized with HIV-1 infected cells produced two human mAbs, 9F11 and 2G9, that reacted with HIV-1 infected cells. 2G9 induced apoptosis of HIV-1 infected cells and 9F11 was able to induce complement-mediated cytolysis. None of the mAbs are thought to bind directly to HIV-1. Unlike 2G9, 0.5β:did not react with OM10.1 cells maintained in a latently infected state in the presence of AZT, but it did react when the virus replication was activated in the absence of AZT and in the presence of TNF-α. Okada *et al.* [2005] (**antibody interactions**)

B Cell

- 0.5β: The structure of V3 HIV-1 peptides derived from IIIB and MN isolates when bound to 447-52D was determined by NMR. It was observed that the two different V3 peptides assumed same N-terminal strand conformation when bound to this Ab. V3 peptide IIIB bound to Ab 0.5β differed from the same petide bound to 447-52D by 180 degrees N-terminal chain orientation. It is suggested that the conformation of an Ab-bound V3 peptide is dictated not only by the peptide sequence but also by an induced fit to the specific Ab. Dominant interactions of 0.5β with residues at variable positions 313 and 315 and interactions with an insertion may be responsible for the strain specificity of this Ab. Rosen *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**, **structure**)
- 0.5beta: Studies on the temperature dependence of infectious virus (increased temperatures up to 37 degress increases infectivity) showed that X4 pseudoviruses that were infectious at room temperature were also more resistant to anti-V3 0.5beta and anti-CXCR4 blocking peptide T140. This implies that virus more heavily populated with functional envelopes are more infectious. Harada *et al.* [2004] (**co-receptor**)
- 0.5beta: 0.5beta was used as a control for gp120 expression relative to Nef expression soon after infection of cultures. The goal of this study was to elicit anti-Nef IgM human Abs in trans-chromosome mice that carry human chromosomes responsible for Ig production. These mice were immunized with recombinant Nef protein. Human heavy chain, mouse light chain anti-Nef IgM were obtained. The hope was that these human IgM anti-Nef chimeric Abs would activate complement mediated cytolysis; C3 deposition was induced but not at high enough levels to induce lysis. Kawai *et al.* [2003] (**complement**)
- 0.5beta: Host encoded intercellular adhesion molecule (ICAM-1) is incorporated by the HIV-1 virion and enhances viral infectivity – ICAM-1 does not modify virus sensitivity to antibodies 0.5beta or 4.8D or sCD4, but neutralizing ability of F105 was diminished in ICAM bearing virions in the presence of lymphocyte function-association antigen-1 (LFA-1) Ab. Fortin *et al.* [2000] (**antibody interactions**)
- 0.5beta: MAbs 0.5beta and G3-42 were used to study synthesis of oligomeric and monomeric forms of Env – inhibition of glycosylation by tunicamycin results in reduction of oligomeric gp120 at the cell surface and of monomer in the cytoplasm – neither MAb recognized non-glycosylated Env precursor. Jagodzinski & Trzeciak [2000]
- 0.5beta: 14/18 residues of peptide P1053, RKSIRIQRGPGRAFVTIG, were shown to be involved in the Ab recognition site using NMR – QRGPGR forms a beta-hairpin turn at the center of the binding pocket. Tugarinov *et al.* [2000] (**antibody binding site definition and exposure**)
- 0.5beta: NMR and mutation cycles were employed to generate a model of the peptide-antibody complex, showing aa residues that interact or do not contribute to the binding of MAb 0.5beta Fv with the peptide – F96(L) of 0.5beta binds to Pro13, H52(H) interacts with Ile7, Ile9, Gln10, and D56(H) interacts with Arg11 of the V3 loop peptide – RGPG retains hairpin conformation binds in the center of a groove. Zvi *et al.* [2000] (**structure**)
- 0.5beta: NMR structure reveals that Ab bound IIIB-V3 peptide adopts an unexpected type VI cis proline beta-turn. Tugarinov *et al.* [1999] (**structure**)
- 0.5beta: The Fv fragment was purified and the temperature dependence and effect of mutations was studied. Faiman & Horovitz [1997]
- 0.5beta: Relative to the native peptide, an O-linked alpha-galactosamine modified V3 peptide enhanced binding to 0.5 beta, while an N-linked beta-glucosamine modified peptide showed reduced binding. Huang *et al.* [1997] (**antibody binding site definition and exposure**)
- 0.5beta: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- 0.5beta: The structure of a 17 amino acid V3 peptide bound to the Fab was studied using NMR. Zvi *et al.* [1997] (**structure**)
- 0.5beta: For Fv fragment of 0.5beta, the combined variable regions of the heavy and light chain residues, were purified. Binding of the V3 peptide epitope TRKSIRIQRGPGRAFVTIGK was studied through mutagenesis of arginines and the free energy of binding in various salt concentrations. R4A, R8A, and R11A all reduce the free energy; R8 is embedded in the peptide-Fv fragment, while R11 is more solvent exposed. Faiman *et al.* [1996] (**antibody binding site definition and exposure**)
- 0.5beta: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS inhibits 0.5beta binding – 0.5beta epitope described as GPGRAFVTIG. Jagodzinski *et al.* [1996]
- 0.5beta: Deletion of the V1V2 regions did not affect anti-V3 Abs ability to bind when compared to intact rec gp120. Jeffs *et al.* [1996] (**antibody binding site definition and exposure**)
- 0.5beta: Synergistic neutralization of HIV-1 when combined with anti-V2 MAb C108G. Warrier *et al.* [1996] (**antibody interactions**)
- 0.5beta: The interactions of the peptide RKSIRIQRGPGRAFVT 0.5beta were studied by NMR, and hydrophobic interactions between the two Is and the V form the base of a 12 amino acid loop with GPGR at the apex. Zvi *et al.* [1995b] (**antibody binding site definition and exposure**)
- 0.5beta: NMR of 0.5beta bound NNTRKSIRIQRGPGRAFVTIGKIG suggests that the bound amino acids are in the region SIRIQRGPGRAFVT. Zvi *et al.* [1995a] (**antibody binding site definition and exposure**)
- 0.5beta: Type-specific neutralization of IIIB – does not neutralize SF2. Broder *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- 0.5beta: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – this MAb can inhibit gp120 binding to GalCer *in vitro*. Cook *et al.* [1994] (**brain/CSF**)
- 0.5beta: Binding domain aa 310-319: RGPGRAFVTIGKIG – mutations in the V3 loop from basic residues can destroy virus infectivity and syncytium formation: R306T, R309T and R313G can also reduce binding of V3 MAbs with two different binding sites: 9284 and 0.5beta. Okada *et al.* [1994] (**antibody binding site definition and exposure**)

B Cell

- 0.5beta: gp41 mutation that confers resistance to neutralization by anti-CD4 binding site antibodies does not reduce neutralizing efficiency of this V3 region MAb. Thali *et al.* [1994]
- 0.5beta: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to some antiserum and conformationally sensitive neutralizing MAbs – neutralization efficiency of 0.5beta is not affected. Klasse *et al.* [1993a]; Reitz *et al.* [1988] (**antibody binding site definition and exposure**)
- 0.5beta: Binding to native gp120 100-300 fold greater than to denatured. Moore *et al.* [1993b] (**antibody binding site definition and exposure**)
- 0.5beta: Monoclonal anti-idiotype antibodies that mimic the 0.5beta epitope were generated. Sperlagh *et al.* [1993] (**anti-idiotype**)
- 0.5beta: A neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – of the MAbs tested , 0.5beta neutralization was the most profoundly affected by this mutation. Watkins *et al.* [1993] (**escape**)
- 0.5beta: Neutralization of virus carrying an A to T substitution (contrast with MAb M77) di Marzo Veronese *et al.* [1993]
- 0.5beta: sCD4 causes loss of IIIB type-specificity, allowing binding and neutralization of MN, in contrast to MAb mu5.5. Maeda *et al.* [1992]
- 0.5beta: Chimeric mouse-human MAb Cbeta1 was constructed by combining the human Cgamma1 and Ckappa constant regions with the 0.5beta murine MAb – ADCC and neutralizing activity. Matsushita *et al.* [1992] (**complement**)
- 0.5beta: Potent neutralizing activity. D'Souza *et al.* [1991]
- 0.5beta: Emergence of virus resistant to MAb 0.5beta and autologous sera neutralization in IIIB infected chimps. Nara *et al.* [1990] (**escape**)
- 0.5beta: Type-specific neutralization of IIIB – does not neutralize MN or RF. Matsushita *et al.* [1988]; Skinner *et al.* [1988b] (**antibody generation**)

- Cβ1: This review summarizes the use of Cβ1 Ab in passive immunoprophylaxis against HIV in primates. Kramer *et al.* [2007] (**immunotherapy**, **review**)
- Cβ1: This Ab does not neutralize HIV-1 AD8, SHIV 89.6 and SHIV C2/1. Eda *et al.* [2006b]
- Cβ1: This MAb was used as a negative control in KD-247 ex-vivo neutralization studies. It did not suppress viral replication of virus from two patients. Suppression was achieved with KD-247 early on, and decreased later to virus production similar to that found in cultures with Cβ1. Matsushita *et al.* [2005] (**neutralization**)
- Cβ1: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**co-receptor**, **immunotherapy**, **review**)
- Cβ1: Review of passive immunoprophylaxis with human NAbs that also includes this chimeric mouse-human MAb, noting it protected 2/2 Chimpanzees from HIV-1 IIIB infection in the Emini *et al.*study published in 1992. Ferrantelli & Ruprecht [2002]
- Cβ1: Defines epitope as IQRGPGRA – strong neutralizing activity against NL4-3 (X4 virus) and none against JRFL (R5 virus) – used as a control in a study of NAb activity in patients undergoing HAART. Kimura *et al.* [2002]
- Cβ1: passive transfer to chimpanzees confers protection against challenge with homologous cell-free virus – mouse 0.5beta human IgG1 chimera. Emini *et al.* [1992]
- Cβ1: Chimeric mouse-human MAb Cbeta1 was constructed by combining the human Cgamma1 and Ckappa constant regions with the 0.5beta murine MAb – ADCC and neutralizing activity. Matsushita *et al.* [1992]

- C25: A new humanized MAb recognizing the V3 tip sequence was generated by transferring the genes of the complementary determining region of the mouse NAb C25 into genes of a human V region. C25 was raised by serial vaccinations of a C3H/HeN mouse with six distinctive B clade V3 loop peptides. KD-247 was shown to neutralize laboratory and primary isolates of CXCR4 and CCR5 viruses that possess a GPGR sequence in the Env V3 tip region more effectively than any of the reference Abs used in the study. Eda *et al.* [2006b] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **antibody sequence variable domain**)
- C25: C25 was obtained by sequential immunization of mice with six V3 peptides. C25 was humanized to obtain KD-247, by transfer of C25 complementary determining regions (CDRs) into the human immunoglobulin framework. The properties of KD-247 were evaluated. - 447-52D: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by

B Cell

NAbs. V3 Ab activity was measured by three assays where 447-52D was used as a control. A V3 peptide derived from the N-terminal part of the V3 loop, including the crown, potently inhibited neutralization of several HIV-1 isolates by 447-52D, indicating that V3 Abs are commonly directed to the N-terminal part of the V3 loop. Binley *et al.* [2008] (**neutralization**)

- 447D: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. When the V1 loop of the heterologous isolates was replaced by the V1 loop present on the DF162go140 immunogen, these isolates became susceptible to neutralization by anti-V3 MAb 447D, indicating that the V1 loop plays an important role in the resistance of heterologous viruses to neutralization. Ching *et al.* [2008] (**neutralization**)
- 447-52D: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. 447-52D captured modestly (but not significantly) fewer mutant pseudovirions than wild type, neutralization was not tested. Dey *et al.* [2008] (**binding affinity**)
- 447-52D: The study determined a crystal structure of Fab 447-52D in complex with a V3 peptide NNTRKSIHLGPGRAFYATGDIIG at 2.1 A resolution. The structure revealed an extended CDR H3 loop that forms a β-sheet with the peptide, with predominantly main-chain hydrogen bonds contacts. There was high structural homology with reported structures of other Fab 447-52D complexes, indicating that the V3 loop may adopt a small set of conserved structures around the crown of the β-hairpin. Dhillon *et al.* [2008] (**structure**)
- 447-52D: Requirements for elicitation of CD4i Abs were examined by immunizing non-primate monkeys, rabbits, and human-CD4 transgenic (huCD4) rabbits with trimeric gp140. The trimers used for the immunizations were inoculated with PBMCs, and CD4-specific binding to live CD3+/CD4+/CD8- cells was verified by recognition of the trimers by 447-52D. Forsell *et al.* [2008]
- 447-52D: Variable domains of three heavy chain Abs, the VHH, were characterized. The Abs were isolated from llamas, who produce immunoglobulins devoid of light chains, immunized with HIV-1 CRF07_BC, to gp120. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. 447-52D provided some inhibition of binding of the three neutralizing VHH Abs to gp120, suggesting that 447-52D imposes steric hinderance to binding of the VHH Abs to gp120. Forsman *et al.* [2008] (**binding affinity**)
- 447-52D: A mathematical model was developed and used to derive transmitted or founder Env sequences from individuals with acute HIV-1 subtype B infection. All but three of the transmitted or early founder Envs were resistant to neutralization by 447-52D, indicating that the coreceptor binding surfaces on transmitted/founder Envs are conformationally masked. sCD4 could trigger a conformational change in gp120 of these Envs and render the virus susceptible to neutralization by 447-52D. Keele *et al.* [2008] (**neutralization**, **acute/early infection**)
- 447-52D: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. Binding of 447-52D to gp120SF162 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with intact 447-52D epitope. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Purified gp140DF162ΔV2 was recognized by 447-52D, and the k-off value for 447-52D was reduced compared to gp120SF162 monomer, consistent with the gp140DF162ΔV2 trimeric conformation. Binding of 447-52D to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **kinetics**, **binding affinity**)
- 447D: 447D neutralized 6 of the 15 subtype B isolates tested, of which 5 were resistant to neutralization by MAbs 19b, 39F, CO11, F2A3, F530, LA21 and LE311. Angle of interaction between 447D and V3 was shown by superimposing the Fab fragment of the Ab with V3. 447D was shown to interact with V3 from a nearly identical angle as MAb 58.2. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **structure**)
- 447-52D: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. 447-52D belonged to the group 2 MAbs, which are able to bind subtype B but not subtype C gp120, and are able to bind both V3 peptides. 447-52D was able to bind subtype B V3 in the subtype C Env backbone chimera, but not the reverse, indicating that 447-52D binds to a structure created by the subtype B V3 sequence that is not impacted by the gp120 backbone. For subtype B, 447-52D required an R18 residue in order to bind, but the binding was not significantly affected by the H13R change. For subtype C, Q18R mutation did not restore binding to gp120, but the R13H-Q18R double mutation did. Peptide binding was affected only by the R13H mutation, indicating that the poor binding of Q18R gp120 mutant has a structural basis. 447-52D was not able to neutralize JR-FL isolate, and somewhat neutralized SF162. A chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. Patel *et al.* [2008] (**neutralization**, **binding affinity**, **subtype comparisons**)
- 447-52D: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by 447-52D,

compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. None of the control or resistant viruses were sensitive for neutralization by 447-52D, although 447-52D bound strongly to gp120 from CC1/85 and CC101.19. These results indicate that V3-dependent and -independent changes responsible for CCR5 inhibitor resistance do not necessarily alter the exposure of V3 to some of the V3 Abs. Pugach *et al.* [2008] (**co-receptor**, **neutralization**, **binding affinity**)

- 447D: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. 447D recognized both B and C trimers with similar efficiency, indicating that the epitope recognized by this Ab is exposed and preserved in the subtype C trimers. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)
- 447-52D: The neutralization profile of early R5, intermediate R5X4, and late X4 viruses from a rhesus macaque infected with SHIV-SF162P3N was assessed. The parental R5 virus was resistant to neutralization by 447-52D, while both the R5X4 intermediate and the late X4 viruses were sensitive to neutralization by 447-52D. The enhanced neutralization susceptibility of the dual-tropic and the X4 viruses to 447-52D suggests adoption of an increasingly open conformation of the Env gp120 over time. Tasca *et al.* [2008] (**co-receptor**, **neutralization**)
- 447-52D: A significantly higher level of 447-52D bound to gp120 complexed with anti-CD4bs mAbs than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of anti-CD4bs Abs to gp120 increases exposure of specific V3 mAb epitopes. Visciano *et al.* [2008b] (**antibody binding site definition and exposure**)
- 447-52D: To test whether the conformation change of Env induced by CD4 affects the breadth and potency of 447-52D neutralization, 447-52D was tested in the presence or absence of sCD4 in neutralization of a panel of 12 subtype B and 12 subtype C Env-pseudoviruses. Without sCD4, 447-52D neutralized 2 subtype B and 0 subtype C viruses. With sCD4 present, 447-52D neutralized 7 subtype B and 1 subtype C virus, indicating that neutralization resistance of some viruses to 447-52D is due to a lack of exposure of the V3 loop. Neutralization of JRFL, ADA, and YU2 isolates by 447-52D increased with increased dose of sCD4. A virus with GPGG sequence at the tip of the V3 loop did not react with 447-52D, indicating that amino acid sequence variation may account for the neutralization resistance of other viruses. The presence of b12 and F105 did not induce 447-52D mediated neutralization of JRFL virus, indicating that b12 and F105 do not induce a conformation alternation in Env that exposes V3 loop to 447-52D. Wu *et al.* [2008] (**neutralization**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Current insights into CTLs and NAbs, and their possible protective mechanisms against establishment of persistent HIV/SIV infection are discussed. Pre- and post-infection sterile and non-sterile protection of NAbs against viral challenge, and potential role of NAbs in antibody-mediated antigen presentation in modification of cellular immunity, are reviewed. 447-52D anti-viral activity in suppression of viral rebound in HIV-1 infected humans undergoing structured treatment interruptions is described. Yamamoto & Matano [2008] (**supervised treatment interruptions (STI)**, **review**)
- 447-52D: 447-52D bound only to V3 peptides from the three isolates (MN, SHIVsf162p3 and clade B consensus) which contain GPGR motif. 447-52D did not recognize one B consensus peptide that did contain GPGR motif. Glycosylation of the position 154 in V1 was more important for the protection of the virus from this Ab than glycosylation of the position 195 in V2. 447-52D neutralized chimeric viruses 89.6/SF162V1, JRFL/SF162V1, YU2/SF162V1 and HxB2/SF162V1 more efficiently than their wildtype counterparts, indicating that the accessibility of the V3 loop is affected by the nature of the V1 loop. Derby *et al.* [2007] (**neutralization**, **binding affinity**)
- 447-52D: This Ab was used to help define the antigenic profile of envelopes used in serum depletion experiments to attempt to define the neutralizing specificities of the broadly cross-reactive neutralizing serum. Peptides containing epitopes for 447-52D did not inhibit neutralization by broadly neutralizing sera from two clade B and one clade A infected asymptomatic individuals, indicating that the V3 epitope for this MAb did not account for the broad neutralizing activity observed. 447-52D bound to JR-FL and JR-CSF gp120 monomers but not to core JR-CSF gp120 monomer. Dhillon *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**)
- 447-52D: HIV-1 env clones resistant to cyanovirin (CV-N), a carbohydrate binding agent, showed amino acid changes that resulted in deglycosylation of high-mannose type residues in the C2-C4 region of gp120. Compared to their parental virus HIV-1 IIIB, these resistant viruses were over 200 times more sensitive to 447-52D, indicating that deglycosylation in CV-N resistant viruses is likely o make the V3 loop more accessible to Abs. Hu *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **escape**)
- 447-52D: This review summarizes current knowledge on the various functional properties of antibodies in HIV-1 infection, including 447-52D mAb, in vivo and in vitro activity of neutralizing Abs, the importance and downfalls of non-neutralizing Abs and antibodies that mediate antibody-dependent cellular cytotoxicity and the complement system, and summarizes data on areas tht need future investigation on Ab-mediated immune control. Huber & Trkola [2007] (**review**)
- 447-52D: Viruses from early and late infection of a macaque with SHIV SF162P4 were resistant to contemporaneous serum that had broadly reactive NAbs. SF162 was highly susceptible to neutralization by anti-V3 MAbs 447D and P3E1, as well as anti-V1 MAb P3C8, while envelopes cloned from this animal at 304 days and at 643 days (time of death) post infection had developed resistance to all three of these antibodies. Kraft *et al.* [2007] (**neutralization**, **escape**)
- 447/52D: This review summarizes 447-52D Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)

B Cell

- 447-52D: G1 and G2 recombinant gp120 proteins, consisting of 2F5 and 4E10, and 4E10 epitopes, respectively, engrafted into the V1/V2 region of gp120, were tested as an immunogen to see if they could elicit MPER antibody responses. Deletion of V1/V2 from gp120, or its replacement with G1 and G2 grafts, did not greatly affect binding of 447-52D to gp120. Shortening of the N and C termini of the V3 loop enhanced the binding of 447-52D. Law *et al.* [2007] (**vaccine antigen design**)
- 447: 32 human HIV-1 positive sera neutralized most viruses from clades A, B, and C. Two of the sera stood out as particularly potent and broadly reactive. Two CD4-binding site defective mutant Env proteins were generated to evaluate whether Abs to the CD4-binding site are involved in the neutralizing activity of the two sera. The integrity of the wildtype and mutant proteins was tested to their reactivity to the 447 Ab. Li *et al.* [2007b] (**binding affinity**)
- 447-52D: 447-52D structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit anti-V3 Abs, are reviewed in detail. Lin & Nara [2007] (**review**, **structure**)
- 447-52D: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, a summary of the neutralizing activity of mAb 447-52D in different HIV-1 clades is provided. McKnight & Aasa-Chapman [2007] (**variant cross-recognition or cross-neutralization**, **review**)
- 447-52D: Z13e1, a high affinity variant of Fab Z13, was identified through targeted mutagenesis and affinity selection against gp41 and an MPER peptide. Z13e1 showed 100-fold improvement in binding affinity for MPER antigens over Z13. 447-52D was used as a control in this study. 447-52D was shown to clearly bind to monomers of gp120-gp41 while trimer binding was negligible, in accordance with its modest neutralization potency against HIV-1 JR-FL. Nelson *et al.* [2007] (**vaccine antigen design**)
- 447-52D: In this study the neutralization breadth of F425 B4e8 was assessed using a panel of 40 primary HIV-1 isolates, and 447-52D was found to have a similar profile, and was used as a control to gauge the effects of the amino acid substitutions in the V3 region. As expected, replacing Arg 315 with Ala or Gln and Pro 313 with Ala reduced binding affinity of this 447-52D substantially. Ala substitutions of residues in positions 304-309 and 319-320 also unexpectedly resulted in diminished binding affinity of the Ab. Pantophlet *et al.* [2007] (**antibody binding site definition and exposure**, **subtype comparisons**)
- 447-52D: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. 447-52D neutralization properties and binding to HIV-1 envelope, and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, such as 447-52D, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- 447-52D: This Ab was used in the analysis of clade C gp140 (97CN54) antigenicity and was shown to bind with relatively high avidity to the molecule and to dissociate substantially within 420 s. It was also used as a positive control in the neutralization assay. Sheppard *et al.* [2007b] (**neutralization**, **variant cross-recognition or cross-neutralization**, **kinetics**, **binding affinity**)
- 447-52D: Escape variants with the V3 P313L mutation, or V2 R166K, D167N and P175L mutations, were resistant or partially resistant, respectively, to 447-52D. Binding of 447-52D to surface-expressed Env proteins with the V2 mutations was lowered compared to the binding to viruses with no mutations. Binding to surface-expressed Env proteins with the V3 mutation was comparable to the negative controle values. Binding affinity of this Ab for different combinations of V2 and V3 mutants was also tested. Shibata *et al.* [2007] (**escape**, **binding affinity**)
- 447-52D: Data is summarized on the X-ray crystal structures resolution and NMR studies of 447-52D. Sirois *et al.* [2007] (**review**, **structure**)
- 447-52D: Compared to the full-length Con-S gp160, chimeric VLPs containing Con-S ΔCFI gp145 with transmembrane (TM) and cytoplasmic tail (CT) sequences derived from the mouse mammary tumor virus (MMTV), showed higher binding capacity to 447-52D. Chimeric VLPs with only CT derived from MMTV also showed higher binding capacity to 447-52D than the full-length Con-S gp160, however, not as high as the chimeric CT-TM VLPs. Wang *et al.* [2007a] (**binding affinity**)
- 447-52D: 447-52D was not found to inhibit binding of gp120 to DC-SIGN. This Ab bound to Fc-gp120 construct but not to the chimeras missing the V3 loop. Binley *et al.* [2006] (**binding affinity**)
- 447-52D: Guinea-pigs were immunized with 447-52D epitope inserted at three different surface V3 loop locations in the small Escherichia coli Trx protein in order to generate a competent immunogen. Only one complex was shown to successfully generate anti-V3 Abs capable of out-competing 447-52D binding to gp120 and recognizing the same epitope as this Ab. However, these 447-52D-like Abs were not able to affect neutralization of JRFL and BAL. Chakraborty *et al.* [2006] (**neutralization**, **vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **binding affinity**)
- 447-52D: Cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors either with or without broadly cross-reactive neutralizing antibodies were shown to be of comparable susceptibility to neutralization by 447-52D. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 447D: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). 447D recognized SF162gp140 and ΔV2gp140 equally and failed to recog-

B Cell

nize ΔV2ΔV3gp140 and ΔV3gp140. Derby *et al.* [2006] (**antibody binding site definition and exposure**)

- 447-52D: The neutralization potency of this Ab against 7 HIV-1 primary isolates was compared to the neutralization potency of the anti-V3 MAb KD-247. Same Ab concentrations were needed for neutralization of the MN, N-NIID, and 92TH022 isolates, while higher concentrations of 447-52D were needed for the neutralization of the rest of the HIV-1 isolates suggesting KD-247 is more potent. Eda *et al.* [2006b]
- 447-52D: This MAb was derived from plasma from a patient with env clade B virus with the GPGR V3 motif. When cross-reactivity was tested, this Ab bound to the V3subtypeB-fusion protein containing GPGR motif but not to the V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize both clade B psSF162 (GPGR) and clade C psMW965 (GPGQ) virus, and four of subtype B and two of non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 447-52D: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**neutralization**)
- 447-52D: 29 subtype B V3 peptides were designed and used for immunization of guinea pigs. Peptides that induced Abs that neutralized more than 3 HIV isolates were shown to bind to this Ab better than peptides unable to induce neutralization of any of the HIV-1 primary isolates. Haynes *et al.* [2006] (**neutralization**, **binding affinity**)
- 447-52D: Inhibition of R5 HIV replication by monoclonal and polyclonal IgGs and IgAs in iMDDCs was evaluated. The neutralizing activity of 447-52D was observed to be higher in iMDDCs than in PBLs and PHA-stimulated PBMCs. A 90% reduction of HIV infection was observed without induction of MDDC maturation by this mAb. It was also demonstrated that binding of this mAb to HIV-1 was necessary for inhibition of iMDDC infection. Increased expression of FcγRI on iMDDCs increased inhibition of HIV by 447-52D, suggesting the involvment of this receptor in the HIV-inhibitory activity of this mAb. Holl *et al.* [2006b] (**neutralization**, **dendritic cells**)
- 447-52D: The ability of this Ab to inhibit viral growth was increased when macrophages and immature dendritic cells (iDCs) were used as target cells instead of PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs can occur by two distinct mechanisms, neutralization of infectivity involving only the Fab part of the IgG, and, an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**dendritic cells**)
- 447-52D: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, a great reduction in sensitivity to neutralization was observed in the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, CRF02_AG, H and CRF01_AE) except subtype C. This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be great for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 447-52D: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. 447-52D moderately neutralized wildype virus particles. It effectively bound to nonfunctional monomers but not to gp120-gp41 trimers. Monomer binding did not correlate with neutralization, but it did correlate with virus capture. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- 447-52D: The neutralizing capacity and binding of this Ab to the V3 region of gp120, as well as resistance to neutralization in different HIV-1 clades are reviewed. Pantophlet & Burton [2006] (**antibody binding site definition and exposure**, **neutralization**, **review**, **subtype comparisons**, **structure**)
- 47-52D: Binding of this Ab to three V3 peptides was compared to binding of Ab 2219 to the same peptides. 447-52D was shown to bind to V3 MN and V3 UG1033 but not to V3 UR29. Stanfield *et al.* [2006] (**variant cross-recognition or cross-neutralization**, **binding affinity**)
- 447-52D: The G314E escape variant highly resistant to KD-247 was shown to be more sensitive to 447-52D than the wildtype virus. 447-52D was shown to be able to bind well to both mutant and wildtype surface-expressed Envs. Yoshimura *et al.* [2006] (**escape**, **binding affinity**)
- 447-52D: The epitope recognition sequence for this Ab was introduced into the corresponding region of SIVmac239 either alone or together with epitopes for Abs 2F5 and 4E10. The infectivity and replicative capacity of SIV239/447-52D and SIV239/447-52D/2F5/4E10 were, however, not detectable and too low, respectively, to be used for further analyses. Yuste *et al.* [2006] (**SIV**)
- 447-52D: The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. Chimeric Env-pseudotyped virus Ch5, containing all three of the mutations, was more neutralization sensitive to 447-52D than Ch2, which did not contain any of these mutations. Env-pseudotyped viruses containing D457G mutation alone, or in combination with E440G or H564N, were also more sensitive to neutralization by 447-52D than Ch2. Beddows *et al.* [2005b] (**neutralization**)

B Cell

- 447-52D: The structure of the 447-52D MAb and its mechanisms of the V3 loop GPGR motif recognition and binding are reviewed. Engineering of Abs based on revealed structures of broadly neutralizing MAbs is discussed. Burton *et al.* [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 447-52D: MAbs were investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. Visualization of Env-Ab binding was conducted by BN-PAGE band shifts. 447-52D binding to trimer was completely dependent on sCD4, consistent with neutralization. Crooks *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **assay standardization/improvement**)
- 447-52D: Monomeric gp120 and trimeric gp140CF proteins synthesized from an artificial group M consensus Env gene (CON6) bound well to 447-52D, indicating correct exposure of the 447-52D epitope. Gao *et al.* [2005a] (**antibody binding site definition and exposure**)
- 447-52d: 2909 is a human anti-Env NAb that was selected by a neutralization assay and binds to the quaternary structure on the intact virion. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670, 1418, nor 2G12. Gorny *et al.* [2005]
- 447-D: This Ab was used as a control in a peptide adsorption assay. 447-D neutralized the SF162 primary isolate to 95%. When 447-D was pre-incubated with BaL or YU2 V3 loop peptides, nearly all neutralizing activity was inhibited. Grundner *et al.* [2005] (**neutralization**)
- 447-52D: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. 447-52D has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 447-52D: The crystal and nuclear magnetic resonance structures of V3-reactive antibody-peptide complexes were examined. 447-52D completely surrounded V3, suggesting a high degree of accessibility for generating an immune response. Accessibility of V3 to this MAb is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- 447-52D: A series of genetically modified Env proteins were generated and expressed in both insect and animal cells to be monitored for their antigenic characteristics. For 447-52D, five of the modified proteins expressed in insect cells, including 3G mutant (mutations in 3 glycosylation sites), dV1V2 mutant (V1V2 deletions), 3G-2G, 3G-dV2, and 3G-dV2-1G (1G being a mutation near the TM domain), showed higher binding than the wildtype. Of these, the 3G-dV2-1G mutant showed highest binding to 447-52D, indicating that glycosylation of the gp41 domain may affect exposure of the V3 loop. Expressed in animal cells, mutants dV2 and 3G-dV1V2 showed increased binding to 447-52D at relatively high Ab concentrations compared to the wildtype Env. Kang *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 447-52D: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. Neutralization by anti-V3 B clade specific MAbs 447-52D and 4117C was fully blocked by a clade V3 loop fusion protein, but not an A clade fusion protein, while Cameroonian sera neutralization was fully blocked by both A and B clade fusion proteins. Krachmarov *et al.* [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 447D: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. 2 out of 19 pseudoviruses were sensitive to neutralization by 447D, as was the SF162.LS strain. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 447: Pseudoviruses expressing HIV-1 envelope glycoproteins from BL01, BR07 and 89.6 strains were compared in neutralization assays to replication competent clone derived from transfection of 293T cells (IMC-293T) and to the IMC-293T derived from a single passage through PBMC (IMC-PBMC). The neutralization responses of pseudoviruses and corresponding IMC-293T to 447 were similar, while a significant decrease in viral neutralization sensitivity to 447 was observed for the BR07 and 89.6 IMC-PBMC viruses. The decrease was associated with an increase in average virion envelope glycoprotein content on the PBMC-derived virus. Louder *et al.* [2005] (**neutralization**, **assay standardization/improvement**)
- 447-52D: The epitope for the MAb D19 is conserved and embedded in V3. D19 is unique in that for R5 viruses, it was cryptic and did not bind without exposure to sCD4, and for X4 and R5X4 isolates it was constitutively exposed. It had an overlapping binding region with MAbs 447-52D, B4e8, and 268-D, but different reactivity patterns and fine specificity. While B4e8 and 447-52D could bind to the R5 virus BaL in the absence of sCD4, treatment with sCD4 did increase the binding of both B4e8 and 447-52D, but did not impact their ability to neutralize BaL. Lusso *et al.* [2005] (**antibody binding site definition and exposure**)
- 447-52D: The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication in microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels of CD4 for infection, and increased sensitivity to neutralization by sCD4 and 17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1 Bori and microglial-adapted HIV-1 Bori-15 was as-

B Cell

sessed in ELISA binding assays using CD4BS MAbs F105 and IgG1b12, glycan-specific 2G12, and V3-specific 447-52D, and were unchanged. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. Martín-García *et al.* [2005] (**antibody binding site definition and exposure**)

- 447-52D: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **review**, **structure**)
- 447-52D: This study is about the V2 MAb C108g, which is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MAbs 4117c, 2219, 2191, and 447-52D (447-52D was the only one of the 4 V3 MAbs that could neutralize the unmodified JRFL); but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 447-52D: The structure of V3 HIV-1 peptides derived from IIIB and MN isolates when bound to 447-52D was determined by NMR. It was observed that the two different V3 peptides assumed same N-terminal strand conformation when bound to this Ab. V3 peptide IIIB bound to Ab 0.5β differed from the same petide bound to 447-52D by 180 degrees N-terminal chain orientation. It is suggested that the conformation of an Ab-bound V3 peptide is dictated not only by the peptide sequence but also by an induced fit to the specific Ab. Dominant interactions of 447-52D with three conserved N-terminal residues may be responsible for the broadly neutralizing capability of this Ab. Rosen *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**, **variant cross-recognition or cross-neutralization**, **structure**)
- 447-52D: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V3 MAbs (447-52D, 19b, F245-B4e8 and 39F) bound to the GDMR antigen, but either did not bind or had diminished binding to mCHO. Selvarajah *et al.* [2005] (**vaccine-specific epitope characteristics**, **Th2**)
- 447-52D: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**neutralization**, **variant cross-recognition or cross-neutralization**, **review**, **subtype comparisons**)
- 447-52D: This review summarizes data on 447-52D-V3 and 447-52D-V3 peptide X-ray crystallographic structures and NMRs and its neutralization capabilities. The binding mechanism of this Ab to V3 explains its ability to neutralize a wide array of viral isolates. Conformation of the V3 peptide bound to 447-52D is very similar to its conformation when bound to mouse Abs 50.1, 59.1 and 83.1. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **review**, **structure**)
- 447-52D: A T-cell line adapted strain (TCLA) of CRF01_AE primary isolate DA5 (PI) was more neutralization sensitive to 447-52D than the primary isolate. Mutant virus derived from the CRF01_AE PI strain, that lacked N-linked glycosylation at position 197 in the C2 region of gp120, was significantly more sensitive to neutralization by 447-52D then the PI strain. Mutants at positions 138 in V1 and 461/464 in V5 showed lower sensitivity to neutralization by 447-52D. Deglycosylated subtype B mutants at positions 197 and 234 were slightly more neutralizable by 447-52D. Teeraputon *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **subtype comparisons**)
- 447-52D: gp120 alone and gp120 bound to CD4D12 (the first two domains of human CD4) or to M9 (a 27-residue CD4 analog) were used to immunize guinea pigs. Only sera from the gp120-CD4D12 immunized animals showed broadly neutralizing activity. Sera from gp120-CD4D12 and gp120 immunized animals competed equally well with 447-52D, indicating that the V3-loop was accessible in both immunogens. Varadarajan *et al.* [2005] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 447-52D: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. Neutralization outside of the B clade was very rare, and seemed to depend on the presence of a GPGR V3 tip, which is rare outside of the B clade. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 447-52D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary isolates. Although 447-52D was selected using a peptide, it has conformational characteristics. Inter-clade cross-neutralization by anti-V3 conformation-dependent MAbs is reduced. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **review**)

B Cell

- 447-52D: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using V3 peptides, but was an exception in that it is cross-neutralizing. 447-52D neutralized 12/13 clade B viruses. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 447-52D: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 447-52D: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the any of three glycans within or adjacent to the V3 loop (GM299 V3), C2 (GM292 C2), C3 (GM329 C3) increased neutralization susceptibility to 447-52D, but C4 (GM438 C4) or V5 (GM454 V5) removal did not make SF162 more sensitive. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 447-52D: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 447-52D. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 447-52D: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 5/6 anti-V3 MAbs, including 447-52D, had similar binding affinity to soluble SF162 and JR-FL rgp120s, although the V3 loop differs at three positions (HigpgrafyTtgE for JR-FL and TigpgrafyAtgD for SF162). Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 447-52D: A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CCcon19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. 447-52D did not neutralize the primary or passaged variant. Pugach *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **viral fitness and reversion**)
- 447-52D: Analysis of the conformation of 447-52D in complex with the V3MN18 peptide (gp12 aa 310-329, KRKRIHIGPGRAFYTTKN) was undertaken using solid state NMR. The bound peptide had a well defined constrained structure that was in good agreement with solution NMR and crystallographic studies. Sharpe *et al.* [2004] (**structure**)
- 447-52D: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. 447-52D was able to neutralize the SOS protein better than the wildtype, but did not neutralize SOS well when added post-attachment, as the V3 loop is involved in co-receptor engagement. Binley *et al.* [2003] (**vaccine antigen design**)
- 447-52D: The Fv fragment (composed of just the light and heavy variable regions, and the smallest intact binding unit of an Ab) of 447-52 D was expressed and purified. Preliminary NMR with the peptide epitope indicates that an NMR structure determination is feasible. Kessler *et al.* [2003] (**antibody sequence variable domain**, **structure**)
- 447-52D: This paper attempts to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Adding a glycosylation sequon (P313N) to the V3 loop knocked out binding to anti-V3 MAbs loop 2, 19b and 447-52-D. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 447-52D: Virion capture assays are not a good predictor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – Ab 447-52D was able to potently neutralize 89.6 and to neutralize JR-CSF at a high concentration but poorly neutralized ADA – b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, but anti-V3 Abs 447-52D and 19b, which did not neutralize JR-CSF and ADA, captured amounts of p24 equal to or higher than the amounts captured by the neutralizing Ab b12. Poignard *et al.* [2003] (**antibody binding site definition and exposure**, **assay development**, **variant cross-recognition or cross-neutralization**)
- 447-52D: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates.

B Cell

Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

- 447-52D: Review of NAbs. Ferrantelli & Ruprecht [2002]
- 447-52D: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions of clades A(N=2), B(N=4), and F(N=2), limited binding to C(N=3) and D(N=3), and did not bind to CRF01(subtype E, N=2) – the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) – 447-52D bound to primary isolates from all clades except CRF01 (E), was conformationally sensitive and showed the some of the most potent neutralizing activity. Gorny *et al.* [2002] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 447-52D: The feasibility of determining the NMR structure of the V3(MN) peptide bound to the 447-52D Fab fragment was tested and a general strategy for obtaining NMR structures of V3 peptide-Fab fragments developed – preliminary NMR spectra for 447-52D complexed to a 23 amino acid V3 peptide was obtained. Sharon *et al.* [2002] (**structure**)
- 447-52D: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent—antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs—447-D recognized the gp120 monomer much more readily than o-gp140, suggesting the V3 loop is less exposed on o-gp140 and on intact virions. Srivastava *et al.* [2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 447-52D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding – the dissociation constant, Kd of 447-52D for the cell associated primary and TCLA Envs was equal, 3nM. York *et al.* [2001] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **binding affinity**)
- 447-52D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V3 MAbs 447-52D, 838-D, and 1334 bound with a 7-10 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 447-52D: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. Grovit-Ferbas *et al.* [2000] (**vaccine antigen design**)
- 447-52D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – V3 MAbs 447-52-D and 268-10-D did not effect proliferation. Hioe *et al.* [2000]
- 447-52D: Called 447D – SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000] (**antibody binding site definition and exposure**)
- 447-52D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 447-52D showed the highest cross-reactivity, bound to 24/26 viruses tested, but achieved 90% neutralization only against MN, 50% against CA5, and no neutralization was observed for 3 other isolates tested. Nyambi *et al.* [2000] (**subtype comparisons**)

B Cell

- 447-52D: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000] (**antibody binding site definition and exposure**)
- 447-52D: rgp120 derived from a R5X4 subtype B virus, HIV-1 W61D, was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – TCLA strains showed enhanced 447-52D neutralization sensitivity relative to PBMC-adapted lines (32X increase between HIV-1 (M2424/PBMC(p0)) and HIV-1 (M2424/H9(p9)) and a >128X increase between HIV-1 (W61D/PBMC) and HIV-1 (W61D/SupT1) isolates) Beddows *et al.* [1999] (**variant cross-recognition or cross-neutralization**)
- 447-52D: The presence of leukocyte function-associated molecule 1 (LFA-1) promotes virus infectivity and hinders neutralization, and anti-LFA-1 MAbs can enhance the neutralizing effect of anti-HIV V3 MAb 447-52D and anti-HIV CD4BS MAb IgG1b12 – non-neutralizing anti-HIV CD4BS MAb 654-D did not become neutralizing in the presence of anti-LFA-1 MAbs. Hioe *et al.* [1999]
- 447-52D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a] (**review**, **subtype comparisons**)
- 447-52D: MAb peptide-reactivity pattern clustered with the immunological related MAbs: 1334, 419, 504, 447, 453 and 537 – the core amino acids GP tended to be critical for reactivity in this group – 447 reacted with peptides containing GPGR, but also with many lacking this sequence (GPGQ, for example), and it failed to react with 2/14 peptides containing GPGR, illustrating the importance of context. Zolla-Pazner *et al.* [1999b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. Connor *et al.* [1998]
- 447-52D: Kinetic parameters were measured, and the association rates were similar, but dissociation rate constants were quite variable for V3 MAbs, 1324E was comparable to 447-52D. Gorny *et al.* [1998] (**kinetics**)
- 447-52D: Called 447-D – 447-D resistance took longer to acquire in virus with the M184V substituted RT, and had the form (AAC N to TAC Y) at position 5 of the V3 loop, rather than the GPGR to GPGR resistance found with wildtype RT. Inouye *et al.* [1998]
- 447-52D: Inhibits binding of Hx10 to both CD4 positive and negative HeLa cells. Mondor *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 447-52D was the most potent and cross-reactive of 18 human MAbs tested and was the only MAb which bound to virions from isolates CA20 (subtype F), CA13 (subtype H), and VI526 (subtype G) Nyambi *et al.* [1998] (**subtype comparisons**)
- 447-52D: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- 447-52D: Called 447-52-D – The tip of the MN V3 loop was inserted into cold causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 447-52D was among the Abs used – chimeric viruses elicited potent NAbs in guinea pigs against ALA-1 and MN. Smith *et al.* [1998] (**vaccine antigen design**)
- 447-52D: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 447-52D has an epitope involving the tip of the V3 loop, that was previously studied with this method Keller *et al.* [1993] – in Keller *et al.*, with no competition, LxGPxR was the most common six-mer, 38% of the peptides – after competition with a gp120 IIIB ligand (QRGPGR)i, RGPxR was the most common and one peptide had the sequence QRGPGR, showing type specific mimotopes can be enriched by strain specific ligand competition protocols Boots *et al.* [1997]. Boots *et al.* [1997]; Keller *et al.* [1993] (**antibody binding site definition and exposure**, **mimotopes**)
- 447-52D: In a multilaboratory blinded study, failed to consistently neutralize any of nine B clade primary isolates – many of these isolates had the GPGR motif at the apex of the V3 loop. D'Souza *et al.* [1997] (**variant cross-recognition or cross-neutralization**, **assay standardization/improvement**)
- 447-52D: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 447-52D bound monomer, oligomer, and neutralized JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- 447-52D: Used as a control for comparison to five V3 RF selected antibodies – 447-52D was reactive with A, B, and C clade peptides, but not E. Gorny *et al.* [1997] (**subtype comparisons**)
- 447-52D: Called 447 – gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by preincubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. Hill *et al.* [1997] (**co-receptor**)
- 447-52D: Tested using a resting cell neutralization assay. Hioe *et al.* [1997a] (**assay standardization/improvement**)
- 447-52D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail

B Cell

of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Neutralizes TCLA strains but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Viral binding inhibition by 447-D was correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5) Ugolini *et al.* [1997] (**antibody binding site definition and exposure**)
- 447-52D: Called 447-52-D – The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS inhibits 447-52D binding. Jagodzinski *et al.* [1996] (**antibody binding site definition and exposure**)
- 447-52D: Review: called 447-52-D – only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. Sattentau [1996] (**variant cross-recognition or cross-neutralization**, **review**)
- 447-52D: Neutralizes JR-FL – strongly inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**co-receptor**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Called 447 – The tip of the V3 loop was presented in a mucin backbone – higher valency correlates with stronger affinity constant. Fontenot *et al.* [1995] (**vaccine antigen design**)
- 447-52D: Neutralizing (- complement), no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC**, **complement**, **enhancing activity**)
- 447-52D: Binding affected by identity of amino acids flanking GPGR core – poor breadth of primary virus neutralization. Moore *et al.* [1995a] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Review: the V3 loop motif GPGR is not common outside subtype B isolates, MAb 19b is more cross-reactive than 447-52D. Moore & Ho [1995] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Ab-mediated activation of complement on HIV+ cells is higher than Ab independent activation—what has been termed "Ab independent" in fact results in part from IgM in normal human serum that is HIV-cross-reactive. Saarloos *et al.* [1995] (**complement**)
- 447-52D: Called 447d – Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. Sattentau *et al.* [1995] (**vaccine antigen design**)
- 447-52D: Serotyping study using flow-cytometry – bound only to GPGR V3 loop tips. Zolla-Pazner *et al.* [1995] (**antibody binding site definition and exposure**)
- 447-52D: Neutralization of primary and prototype laboratory HIV-1 isolates using a resting cell assay enhances sensitivity. Zolla-Pazner & Sharpe [1995] (**assay development**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Requires GPxR at the tip of the V3 loop, common in B clade – neutralized primary isolates. Conley *et al.* [1994a] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Mild oxidation of carbohydrate moieties does not alter binding. Gorny *et al.* [1994] (**antibody binding site definition and exposure**)
- 447-52D: Neutralization synergy in combination with CD4 binding domain MAbs. Laal *et al.* [1994] (**antibody interactions**)
- 447-52D: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. Moore *et al.* [1994a] (**acute/early infection**)
- 447-52D: GPGQ in MAL resulted in enhanced dissociation – GPGQ in CM234 or K14T did not bind – binding affected by identity of amino acids flanking GPGR core. VanCott *et al.* [1994] (**antibody binding site definition and exposure**)
- 447-52D: Additive neutralization of MN and SF2 when combined with CD4 binding site MAb F105 – supra-additive neutralization of RF. Cavacini *et al.* [1993a] (**antibody interactions**)
- 447-52D: Neutralizes MN and IIIB: GPGR, and binds SF2: GPGR. Gorny *et al.* [1993] (**variant cross-recognition or cross-neutralization**)
- 447-52D: Peptide phage library showed that any of the residues ADGLMNQRS in the X position tolerated in peptides that react well with the antibody. Keller *et al.* [1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Complement mediated virolysis of IIIB, but not in the presence of sCD4. Spear *et al.* [1993] (**complement**)
- 447-52D: 60-fold increase in neutralization potency when combined 1:1 with human MAb 588-D. Buchbinder *et al.* [1992] (**antibody interactions**)
- 447-52D: Requires GPXR at the tip of the V3 loop – neutralizes a broad array of B clade lab isolates. Gorny *et al.* [1992] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 447-52D: Reacts with MN, NY5, CDC4, SF2, RF, WM52, and HXB2. Karwowska *et al.* [1992b] (**variant cross-recognition or cross-neutralization**)

B Cell

- NM-01: Called hNM01. scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. The humanized version of this MAb was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- NM-01: Called hNM01. The CDR region of the murine MAb NM-01 was put into a human IgG frame. The epitope recognition was preserved, but the neutralizing potency of the humanized form was enhanced. It could activate complement. Nakamura *et al.* [2000] (**complement**, **immunotherapy**)
- NM-01: The tip of the MN V3 loop was inserted into cold-causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and NM-01 was among the Abs used – chimeric viruses elicited potent NAbs in guinea pigs against ALA-1 and MN. Smith *et al.* [1998]

Keywords antibody binding site definition and exposure, review, structure

- 59.1: Angle of interaction between 59.1 and V3 was shown by superimposing the Fab fragment of the Ab with V3. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- 59.1: Data is summarized on the X-ray crystal structures resolution and NMR studies of 59.1. Sirois *et al.* [2007] (**review**, **structure**)
- 59.1: The crystal structure of V3-reactive antibody-peptide complexes were examined. 59.1 completely surrounded V3, suggesting a high degree of accessibility for generating an immune response. Accessibility of V3 to this MAb is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- 59.1: This review summarizes data on crystallographic structures of 59.1 binding to its V3 peptide antigens. Conformation of the V3 peptide bound to 59.1 is very similar to its conformation when bound to 447-52D. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 59.1: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001]
- 59.1: The crystal structure of V3 loop peptides bound to Fabs was obtained – conformational changes in the tip of the V3 loop (GPGR) were observed when different MAbs were bound. Stanfield *et al.* [1999]

B Cell

- 59.1: The tip of the MN V3 loop was inserted into cold causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 59.1 was among the Abs used – chimeric viruses elicited potent NAbs in guinea pigs against ALA-1 and MN. Smith *et al.* [1998]
- 59.1: A conformationally restricted analog of the tip of the V3 loop was constructed and bound with Fab 59.1 – crystal structure shows interactions between 59.1 and an MN peptide and 59.1 and the modified peptide are similar, but NMR studies reveal that the modified peptide is more ordered in solution, retaining the Fab bound form. Ghiara *et al.* [1997]
- 59.1: Competition ELISAs with serial deletions produced longer estimate of epitope length than x-ray crystallography or Alanine substitution, RIHIGPGRAFYTT, suggesting significance of non-contact residues. Seligman *et al.* [1996]
- 59.1: Greater affinity for T-cell tropic strain T-CSF than the primary isolate JR-CSF, from which T-CSF was derived. Bou-Habib *et al.* [1994]
- 59.1: Multi-lab study for antibody characterization and assay comparison – neutralizes MN and IIIB. D'Souza *et al.* [1994]
- 59.1: Crystal structure of a 24 amino acid peptide from the V3 loop bound to 59.1 Fab fragment – contact residues IGPGRAF. Ghiara *et al.* [1993]
- 59.1: Synergistic neutralization of MN when combined with sCD4 or the CD4BS MAb F105. Potts *et al.* [1993]
- 59.1: Epitope defined by peptide reactivity and binding affinity with amino acid substitutions – GPGRAF. White-Scharf *et al.* [1993]
- 59.1: Called R/V3-59.1 – potent neutralizing MAb. D'Souza *et al.* [1991]

Keywords antibody binding site definition and exposure, rate of progression

- 902: NIH AIDS Research and Reference Reagent Program: 522.
- 902: 902 did not bind to monomeric nor to oligomeric gp41, it bound to gp120. Binding of this Ab to H9/IIIB-infected cells gave a weak signal which was slightly decreased by sCD4 pretreatment. Binding to H9/MN-infected cells gave no signal regardless of sCD4 pretreatment. Sera from both long-term survivors and AIDS patients enhanced binding of 902 to H9/IIIB-infected cells. Usami *et al.* [2005] (**antibody binding site definition and exposure**, **rate of progression**)
- 902: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin, 932 binding was only decreased by trypsin. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 902: V3-BH10 peptide with loop-structure inhibits IL-2 induced T-cell proliferation, thought to be due to altering intracellular signaling, and MAb 908 can block the peptide inhibition. Sakaida *et al.* [1997]
- 902: Epitope may be partially masked or altered in the oligomeric molecule. Broder *et al.* [1994]
- 902: Used as a control in a study of the influence of oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994]

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, enhancing activity, neutralization, review, vaccine antigen design, variant cross-recognition or cross-neutralization

- 694/98-D: Post-attachment enhancement (PAE), which augmented the level of HIV-1 cell infection by 1.4-fold, was significantly inhibited by 694/98-D mAb. 694/98-D was also shown to suppress the fluidity of the viral and plasma envelopes. It is suggested that the binding of 694/98-D to the viral surface could affect steric alternations of the viral envelope and restrain the envelope from enhancing its fluidity. Thus, suppression of the fluidity of viral envelope could be one additional mechanism for virus neutralization by 694/98-D. Harada *et al.* [2008] (**antibody interactions**, **enhancing activity**, **neutralization**)
- 694/98D: A significantly higher level of 694/98D bound to gp120 complexed with six different anti-CD4bs Abs than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of anti-CD4bs Abs to gp120 increases exposure of specific V3 mAb epitopes. Immunization of mice with gp120 in complex with 694/98D did not elicit higher and faster gp120-specific Ab responses than immunization with gp120 alone or gp120 in complex with other mAbs, in contrast to immunization with gp120/anti-CD4bs mAb complexes. Sera from gp120-694/98D immunized mice showed weak or no neutralizing activity against both homologous and heterologous HIV-1 isolates. Visciano *et al.* [2008b] (**neutralization**, **vaccine antigen design**)
- 694/98D: This MAb bound with high affinity to gp120IIIb. 694/98D did not disassociate from gp120 at acidic pH, but it had no inhibitory effect on gp120 antigen presentation by MHC class II. 694/98D had minimal effect on the rate of gp120 fragmentation by lysosomal enzyme digestion. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)
- 694/98D: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**)
- 694/98-D: Called 694/98. V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using IIIB gp120. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 694-98D: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of the V3 MAbs 694-98D and 447-52D, that both bind near the tip of the loop, was decreased by both thrombin and trypsin. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 694/98D: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 694/98-D: Called 694/98D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002]
- 694/98-D: Called 694 – Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A(CD4BS) , 4117C (plus others, V3) and 697D (and SC258, V2) were used as controls. He *et al.* [2002]
- 694/98-D: A panel of 47 human MAbs was tested against 26 HIV-1 group M primary isolates from clades A through H – 19 V3 MAbs were tested, and of 494 combinations, 44% displayed some viral binding – V3 MAbs tended to have the most cross-reactive binding to clade A, B, C, and D isolates, less to E, F, G, and H – 694/98-D showed intermediate reactivity. Nyambi *et al.* [2000]
- 694/98-D: Called 694/98D – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
- 694/98-D: A Semliki Forest virus (SFV) expression system carrying BX08 env was used to study the conformation of

B Cell

gp120 – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not linear V3 MAbs – expression in rat brain also showed that surface-expressed Env was recognized only by the conformation-dependent antibodies and not by anti-V3 antibodies. Altmeyer *et al.* [1999]

- 694/98-D: Review of clade specificity and anti-V3 HIV-1-Abs. Zolla-Pazner *et al.* [1999a]
- 694/98-D: MAb peptide reactivity pattern clustered with immunological related MAbs: 1108, 386, 268, 311, 257, 694.8 – the amino acids HI tended to be critical for reactivity in this group. Zolla-Pazner *et al.* [1999b]
- 694/98-D: Used to study pre- and post-exposure prophylaxis Hu-PBL-SCID mice infected by an intraperitoneal injection of HIV-1 LAI – MAb half-life in plasma in mice is 9 days – 2 hours post-694/98-D mice were challenged with LAI, and at an Ab concentration of 1.32 mg/Kg, 50% of the mice were infected – one of the infected mice carried the resistant form GRTF rather than GRAF (critical amino acids for binding are GRA) – post-exposure prophylaxis was effective if delivered 15 min post-exposure, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect delivered 4 hours post infection. Andrus *et al.* [1998]
- 694/98-D: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS) Li *et al.* [1998]
- 694/98-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – 694/98-D bound only to B and D clade virions and had limited cross reactivity. Nyambi *et al.* [1998]
- 694/98-D: In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, anti-V3 MAbs were found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan more efficiently than HIV-BRU. Schonning *et al.* [1998]
- 694/98-D: The tip of the MN V3 loop was inserted into cold causing human rhinovirus 14 (HRV14) – chimeras were immunoselected, and chimeric viruses were neutralized by anti-V3 loop antibodies, and 694/98-D was among the Abs used – chimeric viruses elicited potent NAbs in guinea pigs against ALA-1 and MN. Smith *et al.* [1998]
- 694/98-D: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – could only achieve 50% neutralization alone – all Ab combinations tested showed synergistic neutralization – 694/98-D has synergistic response with MAbs F105, 15e, b12, 2F5, 17b, 2G12, and 48d, and with HIVIG. Li *et al.* [1997]
- 694/98-D: ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995]
- 694/98-D: Human HIV-1 infected sera and MAb 694/98 have high reactivity to MN and RF infected H9 cells, but Genentech rec gp120 IIIB vaccine recipients do not. VanCott *et al.* [1995]
- 694/98-D: Serotyping study using flow-cytometry – bound GRAX bearing virus in 10/11 cases – somewhat conformation dependent. Zolla-Pazner *et al.* [1995]
- 694/98-D: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – V3 MAbs can inhibit gp120 binding to GalCer *in vitro* – binding of GalCer to gp120 inhibited but did not completely block MAb binding. Cook *et al.* [1994]
- 694/98-D: 50% neutralization of HIV-IIIB at a concentration of 0.15mug/ml. Gorny *et al.* [1994]
- 694/98-D: Potent neutralization of IIIB – no neutralization synergy in combination with CD4 binding domain MAbs. Laal *et al.* [1994]
- 694/98-D: GRVY did not alter peptide binding – GRVI and GQAW enhanced dissociation – GQVF and GQAL did not bind. VanCott *et al.* [1994]
- 694/98-D: Neutralizes MN and IIIB (GRAF) – binds SF2 (GRAF) – binding reactivity: MN, IIIB, SF2, NY5, RF, CDC4, WM52. Gorny *et al.* [1993]
- 694/98-D: Called 694-D – complement mediated virolysis of IIIB, but not in the presence of sCD4. Spear *et al.* [1993]
- 694/98-D: Type-specific lab isolate neutralization was observed – binds with 1-3 fold greater affinity to gp120 than to peptides. Gorny *et al.* [1992]
- 694/98-D: This MAb was first described here. Skinner *et al.* [1988b]

Keywords variant cross-recognition or cross-neutralization

- 9205 database comment: Also see MAb called 5023A.
- 9205: 2G12 cross-neutralization and escape was the emphasis of this study. The Mab 9205 was used as a control. 9205 did not bind to nor inhibit the strains NDK or HE, while it did neutralize NL43 and MN. Huskens *et al.* [2007] (**variant cross-recognition or cross-neutralization**)
- 9205: Called NEA9205 – gp120 capture ELISAs with MAbs D7324 (anti-C-term) or 9205 (anti-V3) were compared in a study of orientation of glycosylation sites – CD4 binding could only inhibit deglycosylation when gp120 was bound to the plate by D7324, not by 9205, while Abs from HIV-1 infected people inhibited deglycosylation most effectively when gp120 was caught by 9205. Gram *et al.* [2002]
- 9205: Called NEA-9205 – the stoichiometry of MAb neutralization was tested and the data indicated that binding for neutralization was was incremental not all or none, i.e., each envelope oligomer binds a single MAb and each Env oligomer bound reduces the chances of infection – 9205 binds only to Env with a glycosylation site mutation in the V3 loop, A308T. Schonning *et al.* [1999]
- 9205: Called NEA-9205 – The N306 glycan of the V3 loop makes the tip of the V3 loop inaccessible to this MAb in oligomeric Env, loss of this glycan enhances neutralization sensitivity. Schonning *et al.* [1998]
- 9205: Neutralizes IIIB but not MN – significantly slower dissociation constant for IIIB than MN. VanCott *et al.* [1994]
- 9205: Synergy with combinations of CD4-based molecules in inhibition of HIV-1 Env mediated cell fusion. Allaway *et al.* [1993]
- 9205: Called NEA-9205, epitope RIQRGPGRAFVTIGK – reacts with three human brain proteins of 35, 55, 110 kd molecular weight – similar to 9284 – RAF is the core reactivity. Trujillo *et al.* [1993]

Keywords antibody binding site definition and exposure, co-receptor, review

- C12: Tyrosine sulfation of C12 and other Abs, and its effect on Ab binding and neutralization, is reviewed. Lin & Nara [2007] (**review**)
- C12: The CDR3 regions of CD4i Abs (E51, 412d, 17b, C12 and 47e) were cloned onto human IgG1 and tested for their ability to inhibit CCR5 binding. Only E51 successfully immunoprecipitated gp120. Dorfman *et al.* [2006] (**co-receptor**)
- C12: C12 was obtained from an HIV-1 infected individual with a potent and broadly neutralizing activity of his serum. It was shown that scFv C12 was sulfate-modified and it is implied that the sulfates are localized exclusively within the heavy chain CDR3 region of this MAb. Binding efficiency of scFv C12 to ADA gp120 was doubled in the presence of CD4, showing that this MAb is a CD4-induced. Association of scFv C12 with ADA gp120-CD4-Ig complex was partially inhibited by a sulfated peptide with a sequence corresponding to the CCR5 amino terminus, indicating that C12 binds a CD4-enhanced epitope overlapping the binding domain of CCR5 amino terminus. scFv C12 was shown to efficiently bind to gp120 of three R5 isolates but not to the HXBc2 X4 isolate. Choe *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**)

- E51: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. Activity directed to the CD4i epitope of gp120 was assessed by the abilities of the plasmas to inhibit virus capture by the MAb E51 in the presence of sCD4. CD4i titers for the inhibition were high for all the plasmas, and did not differ between the subtypes, suggesting that the contribution of the CD4i-Abs for the plasma neutralization activity was minimal. Binley *et al.* [2008] (**neutralization**, **subtype comparisons**)
- E51: Four consensus B Env constructs: full length gp160, uncleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective uncleaved version mediated infection using the CCR5 co-receptor. CD4 inducible MAbs 17b and E51 were tested for the ability to neutralize the various forms of Con B; as anticipated gp160 and gp145 were not neutralized by these two MAbs, but the gp160-201N/S mutant was neutralized with IC50 values of 10 ug/ml, suggesting increased formation and/or exposure of the co-receptor binding site. The poorly infectious clone WITO4160.27 was also somewhat susceptible to neutralization by these clones. Kothe *et al.* [2007] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)
- E51: E51e structure, sulfation, binding, and neutralization activity are reviewed in detail. Lin & Nara [2007] (**review**)

B Cell

- E51: The CDR3 regions of CD4i Abs (E51, 412d, 17b, C12 and 47e) were cloned onto human IgG1 and tested for their ability to inhibit CCR5 binding. Only E51 successfully immunoprecipitated gp120. The sulfated peptide from E51 (pE51) efficiently bound gp120, was enhanced by CD4, and could neutralize HIV-1 more effectively than peptides based on CCR5. pE51 was able to block infection by a range of subtype B isolates. Dorfman *et al.* [2006] (**co-receptor**)
- E51: Interactions of this MAb with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that E51 interactions with the soluble monomers and trimers were dramatically decreased by GA cross-linking of the proteins, indicating that the E51 epitope was affected by cross-linking. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **binding affinity**)
- E51: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. E51 has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- E51: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**, **review**)
- E51: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **vaccine antigen design**, **review**)
- E51: This Ab bound with an intermediate affinity to gp120IIIb, it did not prevent uptake of gp120 by APCs, and had no inhibitory effect on gp120 antigen presentation by MHC class II. E51 disassociated from gp120 at acidic pH. Lysosomal enzyme digestion of gp120 in complex with E51 yielded fragmentation similar to that of gp120 alone, and digestion rate was intermediate, between the rapid digestion of gp120 alone and the slow digestion of gp120 in complex with high-affinity Ab5145A. It is thus concluded that CD4i Ab E51 does not have an inhibitory effect on gp120 processing and presentation. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)
- E51: E51 was obtained from an HIV-1 infected individual with a potent ELISA response to the gp120. It was shown that this MAb could be sulfate-modified. The results indicated that the sulfates present on E51 are localized on tyrosines within its heavy chain CDR3 region and that they contribute to E51s ability to associate with gp120 of the ADA isoalte. Binding efficiency of E51 to ADA gp120 was increased by 25% in the presence of CD4, showing that E51 is a CD4i Ab. Association of E51 with ADA gp120-CD4-Ig complex was inhibited by a sulfated peptide with a sequence corresponding to the CCR5 amino terminus, indicating that E51 binds a CD4-enhanced epitope overlapping the binding domain of CCR5 amino terminus. Neutralization assays showed that E51 neutralizes primary R5 and R5X4 isolates more efficiently, and X4 isolates less efficiently, than CD4i Abs 17b and 48d. scFv E51 was shown to efficiently bind to gp120 of three R5 isolates and to the HXBc2 X4 isolate. Choe *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**)
- E51: E51 recognizes a highly conserved epitope localized in the basic β19-strand (gp120 aa420-423), a region involved in CCR5 binding. The MAb was isolated from a EBV transformed B-cell line established from an HIV+ individual undergoing early STI. Fab fragments were also produced. E51, like CD4i MAb 17b, blocks CCR5 binding to sCD4-bound gp120. The presence of sCD4 induces a conformational change in gp120, which enhances ligand recognition. The substitutions E381R, F383S, R419D I420R, K421D, Q422L, I423S, and Y435S (HXB2 numbering) all severely reduce 17b and E51 binding. All but I423S also diminish CCR5 binding by more than 50%. The mutation F383S also inhibits sCD4 binding and CD4BS MAb F105 binding, and K421D inhibits F105 binding, but not sCD4. E51 has more cross-neutralizing potency than other prototype CD4i MAbs (17b) for B and C clade isolates. E51 and 17b both neutralized HIV-1 clade B strains HXBc2 and ADA, while JR-FL and 89.6 were only neutralized by E51, not 17b. Clade C strains MCGP1.3 and SA32 were both inhibited by 17b and E51, but E51 was more potent against SA32. Xiang *et al.* [2003] (**antibody binding site definition and exposure**, **antibody generation**, **co-receptor**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- JL413: Phage display was used to create a library of gp120-binding single-chain fragments containing V domain (scFv) constructs derived from PBMC of lupus patients. Lupus patients rarely get HIV/AIDS and can make antibodies that bind to a conserved gp120 determinant. The scFV clone JL413 was able to induce dose-dependent, cross-clade neutralization of primary HIV-1 isolates ZA009 (R5, clade C); BR004 (R5,

B Cell

clade C); Ug046 (X4, clade D); SF162 (R5, clade B), and 231135 (clade B). The scFV clone JL413 recognizes a linear region that overlaps the CD4 T-cell binding site, in contrast to HIV-induced MAbs that bind to this region and are conformation dependent. - G3-537: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

- G3-299: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4-V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- G3-299: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the G3-299 epitope as V3 loop/outer domain. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

B Cell

- G3-299: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- G3-299: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997]
- G3-299: Discontinuous V3-C4 epitope, binding enhanced by a few anti-C1, anti-CD4 binding site, and V2 MAbs – binding reciprocally inhibited by anti-V3 MAbs – G3-229 enhances the binding of some anti-V2 MAbs. Moore & Sodroski [1996]
- G3-299: Epitope described as KQIINMWQKVGKAMYAPPIS – binding resulted in slight gp120 dissociation from virus and exposure of the gp41 epitope for MAb 50-69. Poignard *et al.* [1996a]
- G3-299: Binds with higher affinity to monomer than to oligomer, slow association rate, although faster than other C4 MAbs tested, with more potent neutralization of lab strain. Sattentau & Moore [1995]
- G3-299: C4 region – binds HXB2 20mer KQIINMWQKVGKAMYAPPIS, and SF-2 and MN gp120s – G3-42, G3-299 lower affinity than G3-508, G3-519, and G3-536 – bound native gp120, not denatured – poor peptide binding, epitope spans V3-C4 regions – 433A/L, 435Y/H and 430V/S substitutions impaired binding, V3 loop cleavage or insertion abolished binding. Moore *et al.* [1993b]
- G3-299: Best neutralization of IIIB in panel of 7 MAbs that bind overlapping epitope. Sun *et al.* [1989]

Keywords	antibody binding site definition and exposure, antibody interactions

- G3-42: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an alternative to using bone marrow for generating libraries. G3-42 was among a set of Abs used for competition studies to define the binding sites of the newly isolated MAbs, representing a MAb with a linear C4/V3 epitope. Koefoed *et al.* [2005] (**antibody binding site definition and exposure**)
- G3-42: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the C4-V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 0.5beta: MAbs 0.5beta and G3-42 were used to study synthesis of oligomeric and monomeric forms of Env – inhibition of glycosylation by tunicamycin results in reduction of oligomeric gp120 at the cell surface and of monomer in the cytoplasm – neither MAb recognized non-glycosylated Env precursor. Jagodzinski & Trzeciak [2000]
- G3-42: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999]
- G3-42: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – CRDS potently inhibits G3-42 binding – G3-42 epitope described as KVGKAMYAPP. Jagodzinski *et al.* [1996]
- G3-42: Inhibits binding of many anti-V3, -CD4 binding site, and -C4 region MAbs – enhances binding of some anti-V2 region MAbs. Moore & Sodroski [1996]
- G3-42: Epitope described as KQIINMWQKVGKAMYAPPIS – binding resulted in slight gp120 dissociation from virus and exposure of the gp41 epitope for MAb 50-69. Poignard *et al.* [1996a]
- G3-42: Called G3 42 – Does not inhibit gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study – described as V3-C4 discontinuous epitope. Trkola *et al.* [1996a]
- G3-42: Binds with higher affinity to monomer than to oligomer, slow association rate. Sattentau & Moore [1995]
- G3-42: C4 region – binds HXB2 20mer KQIINMWQKVGKAMYAPPIS, and SF-2 and MN gp120s – G3-42, G3-299 have lower affinity than G3-508, G3-519, and G3-536 – bound native gp120, not denatured – poor peptide binding, epitope spans V3-C4 regions – 433A/L, 435Y/H and 430V/S substitutions impaired binding, V3 loop insertion abolished binding. Moore *et al.* [1993b]

B Cell

- G3-42: Inhibits binding of CD4 inducible MAb 48d. Thali *et al.* [1993]
- G3-42: Neutralization of IIIB but not RF. Sun *et al.* [1989]

Keywords antibody binding site definition and exposure

- CRA1: UK Medical Research Council AIDS reagent: ARP323.
- CRA1: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an HIV-1 + alternative to using bone marrow for generating libraries. CRA1 was among a set of Abs used for competition studies to define the binding sites of the newly isolated MAbs, representing a MAb with a linear C5 epitope. Koefoed *et al.* [2005] (**antibody binding site definition and exposure**)
- CRA1: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- CRA1: C5 region linear epitope, binds weakly to nondenatured monomeric gp120 – reciprocal binding inhibition with anti-C5 antibodies 1C1 and M91 – non-reciprocal binding enhancement some C1 and V2 antibodies – non-reciprocal binding inhibition of some CD4 binding site antibodies. Moore & Sodroski [1996]
- CRA1: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- CRA1: Some C5 mutations abrogate binding 470 P/L or G, 475 M/S, some C2 mutations enhance binding. Moore *et al.* [1994d]
- CRA1: The relative affinity for denatured/native gp120 is 24 – C5 mutations 470 P/L or G, 475 M/S impairs binding to the native gp120 – only mutation 470 P/L impairs binding to denatured. Moore *et al.* [1994c]
- CRA1: Bound preferentially to denatured IIIB and SF2 gp120. Moore & Ho [1993]

Keywords antibody interactions

- M91: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- M91: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- M91: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- M91: C5 region linear epitope, binds weakly to nondenatured monomeric gp120 – M91 binding was enhanced by 1C1, but 1C1 binding was inhibited by M91 – non-reciprocal binding enhancement of C1 and V2 antibodies – non-reciprocal binding inhibition of CD4 binding site antibodies. Moore & Sodroski [1996]
- M91: The relative affinity for denatured/native gp120 is 24 – mutation in position 470 P/L impairs binding. Moore *et al.* [1994c]
- M91: 470 P/L impairs binding, but not 475 D/V, in contrast to CRA1 – some C2 mutations can enhance binding. Moore *et al.* [1994d]
- M91: Immunoblot reactive, RIP negative, but precipitates deglycosylated gp120 – reacts with strains IIIB, 451, MN, RF, and RUTZ. di Marzo Veronese *et al.* [1992]

Keywords antibody binding site definition and exposure

- 9201: This paper describes a slightly different epitope, stating 9201 was raised against the peptide MRDNWRSELIKY, located within the alpha 5 helix in the C5 terminal region of gp120. Two MAbs were used to determine the photodamage location in HIV-1 Env induced by sulfonated anionic porphyrins. The negatively charged porphyrins interact with positive charge in the V3 loop. When light activated, they damage amino acid side chains in the C5 region of Env, as evidenced by inhibition of binding of C5 MAb 9201, but not V3 MAb 13105100. Anionic porphyrins could be used in targeted photodynamic decontamination of biological fluids, such as blood, killing HIV without disabling the function of desirable transfusion products. Dairou *et al.* [2004] (**antibody binding site definition and exposure**)
- 9201: Does not neutralize LAI. This paper notes the peptide binding region is GGGDMRDNWRSE. McDougal *et al.* [1996] (**antibody binding site definition and exposure**)

- B221: UK Medical Research Council AIDS reagent: ARP301.
- B221: Called 221. The MAb CA13 binds to the conserved C1 epitope EDIISLW and was used in conjunction with MAb 221, a MAb that binds to the gp120 C-terminal end, to explore the composition and stability of a highly stable trimeric rgp140 derived from a HIV-1 subtype D isolate containing inter-monomer V3-derived disulfide bonds and lacking gp120/gp41 proteolytic processing. The stability of the trimer indicates it may be a good candidate for structural studies. Billington *et al.* [2007]
- 221: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- B221: MAb generated in a study of the humoral immune response to Baculovirus-expressed mis-folded rgp160 IIIB:NL43, MicroGenSys. Bristow *et al.* [1994]

Keywords antibody binding site definition and exposure, immunotoxin

- 110.1 database comment: There is another antibody with this ID that binds to gp120, but at aa 200-217.
- 110.1: Similarity level of the 110.1 binding site pentapeptide IPIHY to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 0 times, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 110.1: This epitope is similar to a fragment of the human protein mast/stem cell growth factor receptor precursor, VVPTKADKRRSV. Maksiutov *et al.* [2002]
- 110.1: Does not effect LAI viral binding or entry into CEM cells. Valenzuela *et al.* [1998]
- 110.1: Does not neutralize HIV-1 LAI. McDougal *et al.* [1996]
- 110.1: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – MAbs against the carboxy-terminus of gp120 inhibit gp120 binding to GalCer but not as potently as anti-V3 MAbs – binding of GalCer to gp120 does not inhibit MAb binding. Cook *et al.* [1994]
- 110.1: The relative affinity for denatured/native gp120 is 0.7. Moore *et al.* [1994c] (**antibody binding site definition and exposure**)
- 110.1: Polyanionic polysaccharides were proposed to inhibit viral functions such as binding and syncytia formation through interations mediated through the local high positive charge density in the V3 loop. The binding of this antibody is not inhibited by dextransulfate, in contrast to anti-V3 antibodies. Callahan *et al.* [1991]
- 110.1: Difference was noted in the epitope: mapped to aa 421-429 (KQIINMWQE), the T1 sequence – poor efficacy as an immunotoxin when linked to RAC. Pincus *et al.* [1991] (**antibody binding site definition and exposure**, **immunotoxin**)
- 110.1: Referred to as 110-1 – does not inhibit CD4-gp120 binding or neutralize HIV-1 strains. Linsley *et al.* [1988]

Keywords dendritic cells, neutralization

- 450: A mouse CD4 T cell clone proliferated well in response to gp120 alone, and while this response was inhibited when gp120 was complexed with anti-CD4bs Abs, the addition of 450 mAb did not cause any inhibition. These results indicate that anti-CD4bs Abs, but not anti-C5 Abs, inhibit CD4 T cell responses in the murine system. Visciano *et al.* [2008a]
- 450-D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 450-D: CD4BS MAbs when complexed with gp120, inhibit proliferation of gp120-specific CD4 T-cells and IFN gamma production – 450-D does not have this effect and was used as a control in this study. Hioe *et al.* [2001]
- 450-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001]
- 450-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – C5 MAbs 450-D and 750-D did not effect proliferation. Hioe *et al.* [2000]
- 450-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b]
- 450-D: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 50% neutralization could not be achieved at a maximal concentration of 6 mug/ml. Li *et al.* [1997]
- 450-D: No neutralizing activity, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995]
- 450-D: Virions complexed to gp120 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 450-D: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – MAbs against the carboxy-terminus of gp120 do not inhibit gp120 binding to GalCer – binding of GalCer to gp120 does not inhibit MAb binding. Cook *et al.* [1994]
- 450-D: Epitope is defined as PTKAKRR. Gorny *et al.* [1994]
- 450-D: Not neutralizing alone, could synergize anti-CD4 binding site antibody neutralization. Laal *et al.* [1994]
- 450-D: Did not mediate deposition of complement component C3 on HIV infected cells. Spear *et al.* [1993]
- 450-D: Bound to MN, SF-2 and IIIB, but was not neutralizing. Karwowska *et al.* [1992a]

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, dendritic cells, enhancing activity, neutralization

- 670-30D: Post-attachment enhancement (PAE), which augmented the level of HIV-1 cell infection by 1.4-fold, was not inhibited by 670-30D non-neutralizing mAB, but was inhibited by anti-V3 neutralizing mAbs 0.5β and 694/98-D. Unlike the neutralizing Abs, 670-30D did not suppress the fluidity of the viral and plasma envelopes. It is suggested that the binding of the neutralizing Abs to the viral surface could affect steric alternations of the viral envelope and restrain the envelope from enhancing its fluidity. Thus, suppression of the fluidity of viral envelope could be one additional mechanism for virus neutralization by anti-V3 neutralizing mAbs. Harada *et al.* [2008] (**antibody interactions**, **enhancing activity**, **neutralization**)

B Cell

- 670: Mice immunized with gp120-654 complex showed lower levels of lymphoproliferation than mice immunized with gp120-670 complex, indicating that anti-CD4bs Abs supress the induction of CD4 T cell responses in vivo, while anti-C5 Abs do not. However, mice immunized with gp120/654 Ab displayed faster kinetics and higher levels of gp120-specific serum IgG and IgA, but not IgM, indicating that immunization with gp120 in the presence of anti-CD4 Ab alters the immunogenicity of gp120 such that the immune response is dominated by anti-gp120 IgG. Visciano *et al.* [2008a]
- 670D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 670: 2909 is a human anti-Env NAb that was selected by neutralization assay and binds to the quaternary structure on the intact virion. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670, 1418, nor 2G12. Gorny *et al.* [2005]
- 670-30D: A series of genetically modified Env proteins were generated and expressed in both insect and animal cells to be monitored for their antigenic characteristics. 670-30D did not show differences in binding affinities to any of the modified Env proteins or the wildtype. Kang *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 670-30D: A trimeric recombinant gp140 construct was developed for immunization studies. Its structural integrity was assessed by a panel of MAbs. 670-30D recognized both the trimeric gp140 and the monomeric gp120, however, it showed preference for gp120. Kim *et al.* [2005] (**antibody binding site definition and exposure**)
- 670-D: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- 670-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001]
- 670-D: A gp120 C5 MAb used as a negative control in a study of anti-gp41 MAbs. Gorny & Zolla-Pazner [2000]
- 670-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 4 C5 MAbs, 2 bound well, 2 bound weakly – MAb 670-D bound 21/26, and was the most cross-reactive C5 MAb. Nyambi *et al.* [2000]
- 670-D: A Semliki Forest virus (SFV) expression system carrying BX08 env was used to study the conformation of gp120 – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not V3 MAbs – expression in rat brain also showed that surface-expressed Env was recognized only by the conformation-dependent antibodies and not by anti-V3 antibodies. Altmeyer *et al.* [1999]
- 670-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-C5 Abs 670-D and 1331A bound to 3/4 B clade viruses (they didn't bind to IIIB), and to subtype D MAL – 670-D also reacted with subtype A. Nyambi *et al.* [1998]
- 670-D: gp120 can inhibit MIP-1alpha from binding to CCR5, but this inhibitory effect is blocked by pre-incubation of gp120 with three anti-V3 MAbs: 447, 257, 1027 – MAb 670 which binds in the C5 region had no effect. Hill *et al.* [1997]
- 670-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b]
- 670-D: Not neutralizing, positive ADCC activity, and no viral enhancing activity, numbering provided suggests epitope is RRVVQRE. Forthal *et al.* [1995]
- 670-D: Group specific cross-clade binding in serotyping study using flow-cytometry. Zolla-Pazner *et al.* [1995]

Keywords antibody binding site definition and exposure, neutralization

- 1331A: A significantly higher level of anti-V3 Abs (694/98D and 447-52D) and anti-C1 mAb (EH21) bound to gp120 complexed with anti-CD4bs mAbs than to gp120 alone or in complex with other non-CD4bs Abs, while no enhancement was seen with the binding of 1331A, indicating that binding of anti-CD4bs Abs to gp120 increases exposure of specific V3 and C1, but not C5, mAb epitopes. Visciano *et al.* [2008b] (**antibody binding site definition and exposure**)

B Cell

- 1331A: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**)
- 1331A: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003]
- 1331A: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002]
- 1331A: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control as binding was not diminished by treating gp120 with DTT or sodium metaperiodate to reduce disulfide bonds), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades). Gorny *et al.* [2002]
- 1331A: Core epitope dwVVQREKR maps to gp120(510-516) – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – C5 MAbs 858-D, 989-D and 1331A bound with a 5-10 fold preference for the monomer. Gorny *et al.* [2000]
- 1331A: The Ab binding site was studied with epitope excision (protein is bound in native conformation to immobilized MAb, then digested with proteolytic enzymes) and extraction (protein is digested then allowed to react with Ab), followed by mass spectroscopy – two non-contiguous aa in C5 were protected, E-507 and I-487, which are thought to be located on opposite sides of hydrophobic pocket involved in gp120/gp41 interaction. Hochleitner *et al.* [2000b]
- 1331A: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 4 C5 MAbs, 2 bound well, 2 bound weakly – MAb 858-D bound only 4/26, the worst of all anti-C5 MAbs tested, while MAb 1331A, which shares the same core epitope (positions 495-516), bound to 18/26. Nyambi *et al.* [2000]
- 1331A: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-C5 Abs 670-D and 1331A bound to 3/4 B clade viruses (they don't bind to IIIB), and to subtype D MAL. Nyambi *et al.* [1998]

Keywords dendritic cells, neutralization

- 858-D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 858-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – C5 MAbs 858-D, 989-D and 1331A bound with a 5-10 fold preference for the monomer. Gorny *et al.* [2000]
- 858-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 4 C5 MAbs, 2 bound well, 2 bound weakly – MAb 858-D bound only 4/26, the worst of all anti-C5 MAbs tested, while MAb 1331A, which shares the same core epitope (positions 495-516), bound to 18/26 isolates. Nyambi *et al.* [2000]
- 858-D: No neutralizing activity, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995]

B Cell

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, dendritic cells, kinetics, neutralization

- 5F3: 5F3 reacted with maltose-binding proteins MBP30 and MBP32, containing both HR1 and HR2 domains of gp41, but did not react with MBP37 and MBP44, containing only the HR2 domain, nor with MBP-HR1, containing only the HR1 domain. In addition, 5F3 bound to MBP44/N36 and MBP-HR1/C34 complexes reaching a plateau at a concentration of $\sim$ 1 µg/ml. In ELISA, 5F3 reacted with the complex formed between MBP-HR1 and H44 (His-targeted protein) and C34, but failed to recognize the mixture of MBP-HR1 and T20,

B Cell

MBP3 and C34, and MBP3 and H44. In addition, 5F3 recognized the peptide complex N36/C34 but not the peptides individually. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)
- 5F3: This Ab was used in the analysis of clade C gp140 (97CN54) antigenicity and was shown to bind with relaively high avidity to the molecule and did not dissociate within 420 s. 5F3 was also used in a competition assay and shown to inhibit binding of N3C5 Ab by 80-90% and of N03B11 by 98-100%, indicating proximity of their epitopes. Sheppard *et al.* [2007b] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**, **binding affinity**)
- 5F3: This Ab did not inhibit HIV-1 BaL replication in macrophages. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 5F3: Significant levels of 5F3 were shown to bind to HA/gp41 expressed on cell surfaces and this Ab did stain cells expressing HA/gp41 in a fluorescence assay. However, this Ab did not bind to the surfaces of HIV Env expressing cells and a much smaller percentage of the HIV 89.6 Env expressing cells were stained with this Ab than with 2G12, indicating that this Ab recognition site on gp41 is masked by the gp120 subunit in the HIV Env protein and that it is more easily accessible on the HA/gp41 chimeric protein. Ye *et al.* [2006] (**antibody binding site definition and exposure**, **binding affinity**)
- 5F3: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding of certain MAbs and increased neutralization resistance to MAbs as well as to human polyclonal HIV-Ig and pooled human sera. 5F3 MAb did not neutralize the LLP-2 mutant nor the wildtype virus. 5F3 exhibited similar levels of binding to both LLP-2 mutant and the wildtype virus. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 5F3: This epitope is similar to a fragment of the HLA class II histocompatibility antigen, GGSCMAALTVTLTV. Maksiutov *et al.* [2002]
- 5F3: Human MAb generated by electrofusion of PBL from HIV-1 + volunteers with CB-F7 cells. Buchacher *et al.* [1994]

- 50-69: NIH AIDS Research and Reference Reagent Program: 531.
- 50-69: 50-69 reacted with maltose-binding protein MBP32, containing both HR1 and HR2 domains of gp41, but did not react with MBP37 and MBP44, containing only the HR2 domain, nor with MBP-HR1, containing only the HR1 domain. In addition, 50-69 bound to MBP44/N36 and MBP-HR1/C34 complexes reaching a plateau at a concentration of ~ 1 µg/ml. In ELISA, 50-69 reacted with the complex formed between MBP-HR1 and H44 (His-targeted protein) and C34, but failed to recognize the mixture of MBP-HR1 and T20, MBP3 and C34, and MBP3 and H44. In addition, 50-69 failed to recognize the peptide complex N36/C34. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)
- 50-69: Increased binding of 50-69 Ab to gp41 in the presence of CD4 was abrogated by the small molecule HIV-1 entry inhibitor IC9564, suggesting that IC9564 arrests gp120 into a fusion-incompetent conformation unable to expose 50-69 epitope. Huang *et al.* [2007b] (**antibody binding site definition and exposure**)
- 50-69: To test the immunogenicity of three molecularly engeneered gp41 variants on the cell surface their reactivity with 50-69 Ab was assessed. The reactivity of 4cSSL24 variant was comparable to gp160 while the other two variants were not recognized by this Ab since the epitope for this Ab was not present in these variants. Kim *et al.* [2007] (**binding affinity**)
- 50-69: This Ab was used in the analysis of clade C gp140 (97CN54) antigenicity and was shown to bind to this molecule. 50-69 was also used in a competition assay where it was shown to mildly inhibit binding of N3C5 Ab and relatively inhibit binding of N03B11 Ab (43-61%), indicating proximity of their epitopes. Sheppard *et al.* [2007b] (**antibody binding site definition and exposure**, **antibody interactions**, **variant cross-recognition or cross-neutralization**, **binding affinity**)
- 50-69: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurrs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 50-69: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. 50-69 exhibited similar levels of binding to both the LLP-2 mutant and wildtype viruses, indicating that its epitope was not altered by the mutation. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)

B Cell

- 50.69: 50.69 was found to bind to both monomeric and oligomeric gp41. Binding of this Ab to H9/IIIB-infected cells gave a strong signal which was increased by sCD4 pretreatment. Binding to H9/MN-infected cells gave a low signal which increased dramatically with sCD4 pretreatment. Sera from both long-term survivors and AIDS patients inhibited binding of 50.69 to H9/IIIB-infected cells. Usami *et al.* [2005] (**antibody binding site definition and exposure**, **rate of progression**)
- 50-69: This is one of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 50-69: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. gp41 MAbs 246D, 98.6, 50-69, were decreased by trypsin, unaltered by thrombin, while NAb 2F5 binding was increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 50-69: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. SF162 and each of the five glycosyation mutants studied were all neutralization resistant to 50-69. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 50-69: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**, **kinetics**)
- 50-69: Called 50-69D. Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- 50-69: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**)
- 50-69: This paper primarily concerns 4E10 and Z13, MAbs that both bind proximally to the 2F5 binding site to a conserved epitope, and that neutralize some primary isolates from clades B, C, and E – MAb 50-69 binding to infected cells is enhanced by sCD4, while 4E10 and Z13 binding is essentially unaltered. Zwick *et al.* [2001b] (**antibody binding site definition and exposure**)
- 50-69: A cluster I epitope that binds to rgp41 567-647, recognizes a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41 – this MAb doesn't react with either of the peptides N51 or C43 individually – MAbs 50-69 and 1367 had similar properties – MAb 50-69 bound the fusogenic form of the protein in liquid phase. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 50-69: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 50-69: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 50-69 bound the majority of isolates although binding was moderate to weak – specifies discontinuous binding site range as aa 579-613. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 50-69: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GCSGKLICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613 – identifies non-contiguous W596-G597-C598 and C604-T605 as mini-

B Cell

mal epitope. Mitchell *et al.* [1998] (**antibody binding site definition and exposure**)

- 50-69: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – 50-69 maps to an immunodominant domain in gp41 – three groups of peptides were selected, one which seems most closely related to gp41 sequence peptide consensus is WGCxx(RK)(x n)LxC – the analogous gp41 sequence WGCSGKLIC is present in most M group clades, except D with a common L to H substitution. Boots *et al.* [1997] (**mimotopes**)
- 50-69: Binding of anti-gp120 MAbs IgG1b12 or 654-30D does not mediate significant exposure of the gp41 epitopes for MAbs 2F5 and 50-69. Stamatatos *et al.* [1997] (**antibody interactions**)
- 50-69: Binds to a linear epitope located in the cluster I region – binding of 50-69 and 240-D inhibited by Fabs A1, A4, M8B, M26B, M12B and T2. Binley *et al.* [1996] (**antibody binding site definition and exposure**)
- 50-69: Used to test exposure of gp41 upon sCD4 binding. Klasse & Sattentau [1996]
- 50-69: Does not neutralize HIV-1 LAI. McDougal *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- 50-69: Prebinding of anti-V3, and CD4i MAbs 48d and 17b, but not anti-V2 neutralizing MAbs, expose the 50-69 epitope. Poignard *et al.* [1996a] (**antibody interactions**)
- 50-69: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. Chen *et al.* [1995] (**antibody binding site definition and exposure**)
- 50-69: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 50-69: Preferentially binds oligomer – binding increased after pretreatment of infected cells with sCD4 – binding domain overlaps site that is critical for gp120-gp41 association. Sattentau *et al.* [1995] (**antibody binding site definition and exposure**)
- 50-69: Epitope described as cluster I, 601-604, conformational – does not neutralize IIIB or synergize neutralization by anti-V3 MAb 447-52D or by CD4 BS MAbs. Laal *et al.* [1994] (**antibody binding site definition and exposure**, **antibody interactions**)
- 50-69: Called SZ-50.69 – binds to an epitope within aa 579-613. Eddleston *et al.* [1993] (**antibody binding site definition and exposure**)
- 50-69: Did not mediate deposition of complement component C3 on HIV infected cells unless cells were pre-incubated with sCD4 – complement mediated virolysis of MN and IIIB in the presence of sCD4. Spear *et al.* [1993] (**complement**)
- 50-69: Enhances HIV-1 infection *in vitro* – synergizes with huMAb 120-16 *in vitro* to enhance HIV-1 infection to level approaching that found in polyclonal anti-HIV serum. Robinson *et al.* [1991] (**antibody interactions**, **enhancing activity**)
- 50-69: Two fold increase in binding to gp120 in the presence of bound sCD4. Sattentau & Moore [1991] (**antibody binding site definition and exposure**)
- 50-69: The epitope is affected by the conformation conferred by the two cysteines at amino acids 598 and 604. Xu *et al.* [1991] (**antibody binding site definition and exposure**)
- 50-69: Kills HIV-infected cells when coupled to deglycosylated ricin A chain. Gorny *et al.* [1989] (**immunotoxin**)
- 50-69: Reacts preferentially with gp160 oligomer, compared to gp41 monomer. Pinter *et al.* [1989] (**antibody binding site definition and exposure**)
- 50-69: Combined with deglycosylated A chain of ricin is toxic to lines of HIV-infected T cells (H9) and monocytes (U937). Till *et al.* [1989] (**immunotoxin**)

B Cell

- 41-1 database comment: Also called 41.1, although possibly not, the literature is confusing because two gp41 MAbs that bind to this region with similar names (dash versus period) are listed as murine and human.
- 41-1: Called 41.1, and described as a human MAb, binding 579-604 – a panel of immunotoxins was generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but killing was not directly proportional to binding. Pincus *et al.* [1996]
- 41-1: This antibody to gp41(584-609) Mani *et al.* [1994] seems to have been named the same as a different MAb to gp41(735-752 IIIB) Dalgleish *et al.* [1988]. Dalgleish *et al.* [1988]; Mani *et al.* [1994]
- 41-1: Did not require the C-C disulfide bridge and loop formation, can bind simultaneously with 9-11. Mani *et al.* [1994]
- 41-1: Called 41.1, and described as a human MAb – cross-competes with 41.4 – sCD4 enhances the efficacy of immunotoxins *in vitro* 30-fold – MAb was coupled to ricin A chain (RAC). Pincus & McClure [1993]
- 41-1: Efficacious as an immunotoxin when coupled to RAC – gave linear epitope as gp160 579-603. Pincus *et al.* [1991]
- 41-1: This antibody seems to have been named the same as a different MAb to gp41(735-752). Dalgleish *et al.* [1988]
- 41-1: Broadly reactive. Gosting *et al.* [1987]

- T2: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs and sCD4 were able to shift JR-FL trimers, In contrast, most non-neutralizing Fabs, T2 in particular, bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**neutralization**, **binding affinity**)
- T2: T2 bound to recombinant r-gp41 (HXB2), but not to N35ccg-N13 peptide, which is a soluble homotrimer corresponding to the HIV-1 gp41 NHR region, and not to other gp41, due to absence of the immunodominant loop. T2 did not neutralize HXB2. As other human-derived Abs in this study, T2 has a long CDR H3 (18 residues), and it was shown to bind to Envs used in typical epitope binding assays, unlike the neutralizing Abs in this study. Nelson *et al.* [2008]
- T2: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. T2 did not bind to trimers nor monomers. Although T2 recognizes an epitope on gp41 obscured by proper gp12-gp41 association, it did not bind to gp41 stumps. T2 was, however, able to capture wild-type virus particles with moderate efficiency. Moore *et al.* [2006] (**antibody binding site definition and exposure**)
- Fab T2: Called T2. One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- Fab T2: Binds to cluster I region – competes with MAbs 240-D and 50-69 – conformation sensitive – variable regions sequenced. Binley *et al.* [1996] (**antibody binding site definition and exposure**, **antibody generation**, **antibody sequence variable domain**)

Keywords acute/early infection, assay development

- A combination of 4 antigenic regions was used to differentiate between early (<180 days) and chronic infection. These regions were: p24; the gp41 peptide spanning the immunodominant epitope (IDE) of gp41, RVAVERYLKDQQLLGIWGCSGKICTTAV, and a subtype D version of this peptide; 5 V3 consensus peptides including A, B, C, D, and CRF01-AE; and Integrase. V3 and the IDE provide the best discrimination, with >20 fold higher levels in chronic infection when assayed by EIA using dried serum spots. Antibodies to Integrase and p24 were not as distinctive, and people tend to lose, not increase, responses to p24 over time. This assay can be

B Cell

used to identify samples from early infection with high sensitivity and specificity. Barin *et al.* [2005] (**assay development**, **acute/early infection**)

- 246-D: NIH AIDS Research and Reference Reagent Program: 1245.
- 246-D: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied using preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations. MAb 246-D was used to analyze antigenic properties of construct 92UG-gp140-Fd, derived from isolate 92UG037.8 and stabilized by a C-terminal foldon tag. 92UG-gp140-Fd trimer binds 246-D. There is also strong binding of 246-D with plasmin cleaved 92UG-gp140-Fd. Frey *et al.* [2008] (**antibody binding site definition and exposure**, **binding affinity**)
- 246-D: Post-attachment enhancement (PAE), which augmented the level of HIV-1 cell infection by 1.4-fold, was not inhibited by 246-D non-neutralizing mAB, but was inhibited by anti-V3 neutralizing mAbs 0.5β and 694/98-D. Unlike the neutralizing Abs, 246-D did not suppress the fluidity of the viral and plasma envelopes. It is suggested that the binding of the neutralizing Abs to the viral surface could affect steric alternations of the viral envelope and restrain the envelope from enhancing its fluidity. Thus, suppression of the fluidity of viral envelope could be one additional mechanism for virus neutralization by anti-V3 neutralizing mAbs. Harada *et al.* [2008] (**antibody interactions**, **enhancing activity**, **neutralization**)
- 246-D: 246-D reacted with maltose-binding proteins MBP30 and MBP32, containing both HR1 and HR2 domains of gp41, and with MBP37, containing only the HR2 domain, but not with MBP-HR1, containing only the HR1 domain. In addition, 246-D did not react with MBP44/N36, MBP-HR1/T20, MBP-HR1/H44, and MBP-HR1/C23 complexes. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)

B Cell

- 246-D: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs occurrs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. It is also suggested that this Ab is directed against epitopes distinct from those recognized by NAbs and that it will not imapair virus entry into PBMCs but that it could participate in the protection of mucosal HIV transmission by preventing the infection of macrophages and iDCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 246D: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. 246D exhibited similar levels of binding to both the LLP-2 mutant and wildtype viruses, indicating that its epitope was not altered by the mutation. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 246D: 246D was found to bind to both monomeric and oligomeric gp41. Binding of this Ab to H9/IIIB-infected cells gave a strong signal which was increased by sCD4 pretreatment. Binding to H9/MN-infected cells gave a low signal which increased dramatically with sCD4 pretreatment. Usami *et al.* [2005] (**antibody binding site definition and exposure**)
- 246-D: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 246-D: Called 246D. The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. gp41 MAbs 246D, 98.6, 50-69, were decreased by trypsin, unaltered by thrombin, while NAb 2F5 binding was increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 246-D: Called 246D – Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**antibody binding site definition and exposure**)
- 246-D: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**, **kinetics**)
- 246-D: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- 246-D: Called 246 – Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades tested, A, B, C, D, F and CRF01 (clade E). Gorny *et al.* [2002] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 246-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**)
- 246-D: Core epitope aa 591 to 597, a cluster I epitope that does

not bind to either a peptide complex that approximates the core of the fusogenic form of gp41 or the individual peptides N51 and C43 that form this structure – MAbs 181-D and 246-D had similar properties. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)

- 246-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 246-D bound strongly or moderately to all 26 HIV-1 group M clades viruses tested and showed the strongest binding of all anti-Env MAbs tested, including the V3 and C5 region MAbs – notes core epitope as LLGI – no neutralizing activity was observed when 246-D was tested with five isolates. Nyambi *et al.* [2000] (**subtype comparisons**)
- 246-D: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GCSGKLICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613. Mitchell *et al.* [1998] (**antibody binding site definition and exposure**)
- 246-D: This antibody, along with murine MAb D61, can be blocked by any of a group of 8 conformational MAbs (M10, D41, D54, T4, T6, T9, T10 and T35). Earl *et al.* [1997] (**antibody interactions**)
- 246-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations and 246-D neutralized 91US056 – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 246-D: No neutralizing activity, both ADCC and viral enhancing activity. Forthal *et al.* [1995] (**complement**, **enhancing activity**)
- 246-D: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 246-D: Ab-mediated activation of complement on HIV+ cells is higher than Ab independent activation—what has been termed "Ab independent" in fact results in part from IgM in normal human serum that is HIV-cross-reactive. Saarloos *et al.* [1995] (**complement**)
- 246-D: Called SZ-246.D. Eddleston *et al.* [1993]
- 246-D: Did not mediate deposition of complement component C3 on HIV infected cells unless cells were pre-incubated with sCD4. Spear *et al.* [1993] (**complement**)
- 246-D: No neutralizing activity, some enhancing activity. Robinson *et al.* [1991] (**enhancing activity**)
- 246-D: Fine mapping indicates core is LLGI. Xu *et al.* [1991] (**antibody binding site definition and exposure**)

- 240-D: NIH AIDS Research and Reference Reagent Program: 1242.
- 240-D: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied using preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations. MAb 240-D was used to analyze antigenic properties of construct 92UG-gp140-Fd, derived from isolate 92UG037.8 and stabilized by a C-terminal foldon tag. 92UG-gp140-Fd trimer binds 240-D. There is also strong binding of 240-D with plasmin cleaved 92UG-gp140-Fd. Frey *et al.* [2008] (**antibody binding site definition and exposure**, **binding affinity**)
- 240-D: 240-D reacted with maltose-binding protein MBP32, containing both HR1 and HR2 domains of gp41, and with MBP37, containing only the HR2 domain, but not with MBP-HR1, containing only the HR1 domain. In addition, 246-D did not react with MBP-HR1/T20, MBP-HR1/H44, and MBP-HR1/C23 complexes. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)
- 240-D: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs occurrs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. It is also suggested that this Ab is directed against epitopes distinct from those recognized by NAbs and that it will not imapair virus entry into PBMCs but that it could participate in the protection of mucosal HIV transmission by preventing the infection of macrophages and iDCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 240-D: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 240-D: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**, **kinetics**)
- 240-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 246-D bound strongly or moderately to 24/26 HIV-1 group M clades viruses tested. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 240-D: Mutations in BH10 gp160, W596Y and T605A, as well as deletions of 605-609 (TTAVP) and 597-609 (GCSGK-LICTTAVP), abrogate binding of enhancing MAbs 86, 240D, 50-69, and 246-D – 5/6 enhancing MAbs identified to date bind to the immunodominant region 579-613. Mitchell *et al.* [1998] (**enhancing activity**)
- 240-D: Binds to a linear epitope located in the cluster I region – binding of 50-69 and 240-D inhibited by Fabs A1, A4, M8B,

B Cell

M26B, M12B and T2. Binley *et al.* [1996] (**antibody binding site definition and exposure**)
- 240-D: V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- 240-D: Did not mediate deposition of complement component C3 on HIV infected cells. Spear *et al.* [1993] (**complement**)
- 240-D: No neutralizing activity, some enhancing activity. Robinson *et al.* [1991] (**enhancing activity**)
- 240-D: Fine mapping indicates core is IWG. Xu *et al.* [1991] (**antibody binding site definition and exposure**)

- F240: F240 reacted with maltose-binding protein MBP32, containing both HR1 and HR2 domains of gp41, and with MBP37, containing only the HR2 domain, but not with MBP-HR1, containing only the HR1 domain. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)
- F240: F240 Ab was produced in Chinese hamster ovary (CHO)-K1 cells as three different isotypes, F240-IgG1, F240-IgG3, and F240-IgG4. The produced Abs were shown to be equivalently immunoreactive with recombinant gp140 and primary isolate viruses as the parental F240. In contrast to parental F240, F240-IgG1 from CHO cells was able to neutralize the majority of tier 1 and 2 clade B isolates, and two clade C tier 2 isolates. Clade A tier 2 isolates were not neutralized by this Ab. F240-IgG3 isotype was most potent in neutralizing the virus, while F240-IgG4 was less able to neutralize infection. There were no differences found in the sequences of the L and H chain variable regions of all the F240 Abs, but there was an increase in glycans associated with the Abs generated in CHO cells. PNGase F treatment, which removes all types of N-linked glycosylation, did not affect binding properties of CHO-derived F240 Abs, but it significantly abolished the neutralizing activity of F240 with isolate 89.6. PNGase F-treatment had no effect on the neutralization of SF162 and 93MW960 isolates, while it was required to neutralize the 67970 isolate by F240-IgG1 Ab. Miranda *et al.* [2007] (**isotype switch**, **neutralization**, **binding affinity**, **antibody sequence variable domain**)
- F240: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs occurrs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. It is also suggested that this Ab is directed against epitopes distinct from those recognized by NAbs and that it will not imapair virus entry into PBMCs but that it could participate in the protection of mucosal HIV transmission by preventing the infection of macrophages and iDCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- F240: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. F240 showed a decrease in binding to the LLP-2 mutant compared to the wildtype virus, indicating that its epitope was altered by the mutation. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- F240: Transduction of human CD4+ H9 T cells with both the intracellularly expressed and secreted forms of the single-chain F240 Ab inhibited MN virus production. The secreted form was more potent. Viral replication of HIV-1 primary isolates was not reduced. Liu *et al.* [2005a]
- F240: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- F240: The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. Anti-gp41 MAb F240 could inhibit B4e8 neutralization. Cavacini *et al.* [2003] (**antibody interactions**)
- F240: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate, with the exception of F240 which bound both equally well, which captured more virus than any other human MAb tested, and didn't neutralize either isolate.F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 and the gp41 MAb 2F5 for both R5X4 and R5 isolates. F240 binding to gp41 was not affected by the binding of the V3 loop MAb B4a1, but preincubation with F240 could enhance B4a1 binding of the R5 isolate. Synergistic neutralization between F240 and CD4i MAbs 17b and 48d was noted for the R5X4 but not the R5 isolate, and F240 also enhanced neutralization of the R5X4 isolate by 2F5, but had no effect on R5 virus. In contrast, F240 combined with 2G12 demonstrated enhanced neutralization of R5 virus at low Ab concentrations. Cavacini *et al.* [2002] (**antibody interactions**, **co-receptor**)
- F240: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during bind-

B Cell

ing and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cytoplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**)

- F240: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 sensitivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- F240: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- F240: Distinct from MAb 240-D, an antibody with a similar epitope in the immunodominant region of gp41 – dose-dependent reactivity with HIV isolates RF, SF2, IIIB, and MN was observed – F240 had no neutralizing activity and enhances infection in the presence of complement – reactivity of F240 is enhanced by preincubation of cells with sCD4 or anti-CD4BS MAb F105 – heavy and light chain variable domains were sequenced, and a strong homology to hu MAb 3D6 was observed, as 3D6 binds to the same epitope, these MAbs may define a human Ab clonotype. Cavacini *et al.* [1998a] (**enhancing activity**, **variant cross-recognition or cross-neutralization**, **antibody sequence variable domain**)

Keywords antibody binding site definition and exposure, antibody generation, isotype switch, mucosal immunity

- D61: Several IgG MAbs were isotype switched to IgA and tested for their abilities to generate immune complexes with HIV-1 and be excreted from polarized epithelial cells from the basolateral to the apical surface via polymeric Ig receptor (pIgR) binding. Unlike IgA D10, D47, D19, and D25, IgA D61 was not able to excrete HIV. D61 bound weakly to HIV but the produced immune complex failed to associate with pIgR. These results show that some IgA Abs have potential to excrete HIV from mucosal lamina propria thus decreasing the viral burden and access to susceptible cells. Wright *et al.* [2008] (**isotype switch**, **mucosal immunity**)
- D61: D61 did not compete with the newly defined neutralizing mAb m44 for binding to gp41. Zhang *et al.* [2008]

B Cell

- D61: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b – nor did it alter two gp41 MAbs, T9 and D61, inability to inhibit fusion. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
- D61: Binding maps to region 597-613: WGCSGKLICT-TAVPWNA – immunodominant region containing two Cys residues – this antibody, along with human MAb 246-D, can be blocked by any of a group of 8 conformational MAbs (M10, D41, D54, T4, T6, T9, T10 and T35) – members of this competition group are blocked by sera from HIV-1 + individuals. Earl *et al.* [1997] (**antibody binding site definition and exposure**)
- D61: Linear gp41 epitope in the cluster I region – human sera blocked binding in oligomeric ELISA assay to a similar extent for gp41 MAbs D20, D43, D61, and T4. Richardson *et al.* [1996] (**antibody binding site definition and exposure**)
- D61: Does not precipitate gp41(21-166), but due to a structural difference in the disulfide bonding region near the two cysteines – the authors propose that this region may change conformation during the activation of the membrane fusion state of the HIV-1 glycoprotein. Weissenhorn *et al.* [1996] (**antibody binding site definition and exposure**)
- D61: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody generation**)

- Clone 3: This review summarizes Clone 3 Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)

B Cell

- Clone 3: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **review**)
- Clone 3: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- clone 3: Called CL3 here. Nabs against HIV-1 M group isolates were tested for their ability to neutralize 6 randomly selected HIV-1 O group strains. Clone 3 could neutralize some O group strains. CL3 is specific for a linear epitope containing 2 cysteines that generate a loop that could be important during the fusion of the virus with the target cell. This epitope is represented as GCxGxxxCxT HIV-1 group O isolates. Ferrantelli *et al.* [2004a] (**variant cross-recognition or cross-neutralization**)
- clone 3: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. clone 3 neutralized 3 diverse B clade TCLA strains and 3 primary O group strains. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**, **subtype comparisons**)
- clone 3: Monoclonal antibodies to this epitope have distinct phenotypes—41-7 and 1B8.env were found to be not neutralizing, 2F11 possibly enhancing, and clone 3 beneficial. Enshell-Seijffers *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- clone 3: Inhibits replication of three diverse HIV-1 laboratory strains, as well as an AZT-resistant isolate. Cotropia *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- clone 3: Core binding domain gcsgkLIC – lack of serological activity to this region correlates with rapid progression in infants (Broliden *et al.* [1989]) Cotropia *et al.* [1992]. Broliden *et al.* [1989]; Cotropia *et al.* [1992] (**antibody binding site definition and exposure**, **responses in children**, **rate of progression**)

- 3D6: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 3D6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan

- P3B2: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. When the V1 loop of the heterologous isolates was replaced by the V1 loop present on the DF162go140 immunogen, these isolates became susceptible to neutralization by P3B2. Ching *et al.* [2008] (**neutralization**)
- P3B2: Binding of P3B2 is partially dependent on the conformation of V1, while the presence of V3 is not required. This Ab bound equally to the trimeric and monomeric gp140 from both SF162wt and SF162ΔV2, suggesting that the binding does not require presence of the V2 loop. P3B2 neutralized SF162 potently but it did not have any heterologous neutralizing activity. The Ab did not neutralize virus lacking V1. The SF162ΔV2 virus was significantly more susceptible to neutralization by P3B2 than the wildtype virus. Glycans at positions 154 and 195 in V1V2 were involved in regulating P3B2 neutralizing potential. Neutralization by P3B2 was also enhanced strongly by deletion of the V3 glycan at position 299, somewhat less by deletion at position 329, and only slightly or not at all by deletion of the glycan at position 293. Glycans present in the V4-V5 region had only modest effects on the neutralizing potential of this Ab, where their removal resulted in a more neutralization resistant virus. Derby *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**)

Keywords antibody binding site definition and exposure, binding affinity, escape, neutralization, optimal epitope, vaccine antigen design

- P3C8: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. When the V1 loop of the heterologous isolates was replaced by the V1 loop present on the DF162go140 immunogen, these isolates became susceptible to neutralization by p3C8. Ching *et al.* [2008] (**neutralization**)
- P3C8: The minimal epitope for this Ab is most probably located within the N-terminal portion of the WKEMNRGEIKNCSFN peptide, WKEM(D/N)R. Binding of P3C8 is partially dependent on the conformation of V1, while the presence of V3 is not required. P3C8 neutralized SF162 potently but it did not have any heterologous neutralizing activity. The Ab had potent reactivity with trimeric and monomeric gp140 from both SF162wt and SF162ΔV2. The SF162ΔV2 virus was significantly more susceptible to neutralization by P3C8 than the wildtype virus. P3C8 did not neutralize virus lacking V1 loop. Glycans at positions 154 and 195 in V1V2 were involved in regulating P3C8 neutralizing potential. Neutralization by P3C8 was also enhanced strongly by deletion of the V3 glycan at position 299, somewhat less by deletion at position 329, and only slightly or not at all by deletion of the glycan at position 293. Glycans present in the V4-V5 region had only modest effects on the neutralizing potential of this Ab, where their removal resulted in a more neutralization resistant virus. Derby *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**, **vaccine antigen design**, **binding affinity**)
- P3C8: Viruses from early and late infection of a macaque with SHIV SF162P4 were resistant to contemporaneous serum that had broadly reactive NAbs. SF162 was highly susceptible to neutralization by anti-V3 MAbs 447D and P3E1, as well as anti-V1 MAb P3C8, while envelopes cloned from this animal at 304 days and at 643 days (time of death) post infection had developed resistance to all three of these antibodies. This is a new anti-V1 loop Ab isolated from mice immunized with ΔV2gp140 SF162. Kraft *et al.* [2007] (**neutralization**, **escape**)
- P3C8: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). All four gp140 proteins were recognized by P3C8 equally indicating that the P3C8 epitope is well exposed in all constructs. P3C8 neutralized SF162 efficiently while its neutralization potential was reduced by 81% in the presence of V1 peptides. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)

- P4D7: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. When the V1 loop of the heterologous isolates was replaced by the V1 loop present on the DF162go140 immunogen, these isolates became susceptible to neutralization by p4D7. Ching *et al.* [2008] (**neutralization**)
- P4D7: Binding of P4D7 is partially dependent on the conformation of V1, while the presence of V3 is not required. This Ab bound equally to the trimeric and monomeric gp140 from both SF162wt and SF162ΔV2, suggesting that the binding does not require presence of the V2 loop. P4D7 neutralized SF162 potently but it did not have any heterologous neutralizing activity. The Ab did not neutralize virus lacking V1. The SF162ΔV2 virus was significantly more susceptible to neutralization by P4D7 than the wildtype virus. Glycans at positions 154 and 195 in V1V2 were involved in regulating P3B2 neutralizing potential. Neutralization by P3B2 was also enhanced strongly by deletion of the V3 glycan at position 299, somewhat less by deletion at position 329, and only slightly or not at all by deletion of the glycan at position 293. Glycans present in the V4-V5 region had only modest effects on the neutralizing potential of this Ab, where their removal resulted in a more neutralization resistant virus. Derby *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**)

- P3C5: P3C5 bound to V3 loop peptides with lower affinity than P3E1. This Ab bound equally to the trimeric and monomeric gp140 from both SF162wt and SF162ΔV2, suggesting that the binding does not require presence of the V2 loop. P3C5 neutralized SF162 with significantly reduced potency and it did not have any heterologous neutralizing activity. The SF162ΔV2 virus was significantly more susceptible to neutralization by P3C5 than the wildtype virus, while neutralization of the virus lacking V1 loop was significantly reduced, suggesting that the positioning of the Ab epitope is affected by the V1 loop. Glycans at positions 154 and 195 in V1V2 were involved in regulating P3C5 neutralizing potential. Neutralization by P3C5 was also enhanced strongly by deletion of the V3 glycan at position 299, somewhat less by deletion at position 329, and only slightly by deletion of the glycan at position 293. Glycans present in the V4-V5 region had only modest effects on the neutralizing potential of this Ab, where their removal resulted in a more neutralization resistant virus. - D50: D50 was shown to bind to Envs used in typical epitope binding assays, unlike the neutralizing Abs 8K8, DN9, and D5 used in this study. Nelson *et al.* [2008]
- D50: D50 did not compete with the newly defined neutralizing mAb m44 for binding to gp41. Zhang *et al.* [2008]
- D50: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**antibody binding site definition and exposure**)
- D50: This review summarizes data on the polyspecific reactivities to host antigens by the broadly neutralizing MAbs IgG1b12, 2G12, 2F5 and 4E10. It also hypothesizes that some

B Cell

broadly reactive Abs might not be routinely made because they are derived from B cell populations that frequently make polyspecific Abs and are thus subjected to B cell negative selection. Different types of anti-MPER Abs are discussed, including D50. Haynes *et al.* [2005b] (**antibody generation**, **antibody interactions**, **review**)

- D50: The MAb 2F5 binds to the C-heptad and is neutralizing, but the MAb D50 binds to the C-heptad and is not neutralizing. 2F5 binds preferentially to native gp41 prior to receptor activation. D50 prefers the triggered form after receptor activation. Trapped fusion-intermediates suggest 2F5 remains present shortly after gp120 triggering by CD4, but may be lost by the time the six-helix bundle is formed. D50 binds equally to the fusion-intermediate and six-helix bundle. 2F5 neutralization seems to block a later step of the fusion process. de Rosny *et al.* [2004b] (**antibody binding site definition and exposure**)
- D50: The mechanism of 2F5 neutralization was explored, and experiments suggest it is due to interference with a late step in viral entry. sCD4 binding to gp120 triggers conformational changes in gp41 allowing formation of the six helix bundle. The NAb 2F5 preferentially bound native gp41, prior to receptor triggering, while the antibody D50 that also binds to the heptad region, near 2F5, is not neutralizing, and preferentially bound the CD4 triggered gp41. The C and N peptides that can be used to block the formation of the six helix bundle and lock gp41 in the fusion intermediate state after sCD4 triggering enabled 2F5 to bind after sCD4 triggering, while D50 was able to bind to both the peptide-trapped and sCD4 induced six helix bundle equally well, suggesting the D50 epitope is linear and more exposed after sCD4 binding. de Rosny *et al.* [2004a] (**antibody binding site definition and exposure**)
- D50: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – D50 was used to capture the o-gp140 for ELISA to test the antigencity of o-gp140 using a panel of well characterized MAbs. Srivastava *et al.* [2002]
- D50: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 timer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-). Yang *et al.* [2000] (**antibody binding site definition and exposure**)
- D50: Found to bind to a linear peptide, between Env amino acids 642-655 – can be blocked by the conformation dependent MAbs D16, D17, D31, D36, D37, D40, D44, D55, D59, T37, and T45 – the region is in the immunogenic cluster two region – reactive with 9/10 HIV-1 strains tested, all except HIV-1 ADA, in which the change E659D and E662A may result in the loss of binding (ELLE to DLLA). Earl *et al.* [1997] (**antibody binding site definition and exposure**)
- D50: Thought to be a discontinuous epitope recognizing residues between 649-668 – designated cluster II – Fabs D5, D11, G1, T3, M12, M15, S6, S8, S9, S10 block binding. Binley *et al.* [1996] (**antibody binding site definition and exposure**)
- D50: Richardson suggests this is a linear gp41 epitope. Richardson *et al.* [1996] (**antibody binding site definition and exposure**)
- D50: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody generation**)

- 98-6: NIH AIDS Research and Reference Reagent Program: 1240.
- 98-6: 98-6 blocked 2F5 and 13H11 binding to gp41 epitopes to variable degrees; the combination of 98-6 and 13H11 completely blocked 2F5 binding. MAb 98-6 showed strong binding to HIV-1-positive infected cells. Alam *et al.* [2008] (**antibody interactions**)
- 98-6: For assessment of gp41 immunogenic properties, five soluble GST-fusion proteins encompassing C-terminal 30, 64, 100, 142, or 172 (full-length) amino acids of gp41 ectodomain were generated from M group consensus env sequence. The three smaller protein fragments were not detected by 98-6, since they do not contain both heptad repeat regions required for coiled-coil structure that contains the 98-6 Ab epitope. GST-gp41-142 and -172 reacted strongly against 98-6, indicating that these protein fragments exist in post-hairpin configuration. Penn-Nicholson *et al.* [2008]
- 98-6: To test the immunogenicity of three molecularly engeneered gp41 variants on the cell surface their reactivity with 98-6 Ab was assessed. The reactivity of 4cSSL24 and gp41d4mt variants was detected while the BAFF-C56 variant was not recognized by this Ab. Kim *et al.* [2007] (**binding affinity**)
- 98-6D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 98.6: 98.6 was found to bind to both monomeric and oligomeric gp41. Binding of this Ab to H9/IIIB-infected cells gave a strong signal which was increased by sCD4 pretreatment. Binding to H9/MN-infected cells gave no signal regardless of sCD4 pretreatment, indicating that the seven amino acids of the C34, which differ between the MN and IIIB strains, are possibly responsible in determining whether 98.6 binds to gp41 or not. Sera from both long-term survivors and AIDS patients inhibited binding of 98.6 to H9/IIIB-infected cells. Usami *et al.* [2005] (**antibody binding site definition and exposure**, **rate of progression**)
- 98-6: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have any neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- 98-6: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. gp41 MAbs 246D, 98.6, 50-69, were decreased by trypsin, unaltered by thrombin, while NAb 2F5 binding was increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 98-6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**, **kinetics**)
- 98-6: Called 98-6D. Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neu-

B Cell

tralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)

- 98-6: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – 98-6 binds to a C-HR hairpin epitope and blocks fusion when added to a 2 hour E/T preincubation at 31.5 C, but if added after 1 hour, doesn't inhibit – this is in contrast to six-helix bundle Abs 167-D and 1281 that inhibit more efficiently when added after one hour of incubation. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
- 98-6: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6—six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D, while six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 98-6: 98-6 and 2F5 both bind to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, and to C43 alone but not to N51 alone – 98-6 and 2F5 have comparable affinities for C43, but 98-6 has a higher affinity for the complex and the binding of 98-6 is not inhibited by N51. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**, **binding affinity**)
- 98-6: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 98-6: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs – no neutralizing activity was observed when tested against 5 isolates, but 98-6 did not bind to these isolates. Nyambi *et al.* [2000] (**subtype comparisons**)
- 98-6: The fusogenic form of gp41 is recognized by 98-6, and the epitope is a conformational epitope formed by the interaction of two regions of gp41 which form an alpha-helical bundle. Taniguchi *et al.* [2000] (**antibody binding site definition and exposure**)
- 98-6: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-gp41 Abs 98-6, 1367 and 1342 were not able to bind detectably with any of the viruses from any clade. Nyambi *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- 98-6: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 98-6: 98-6 is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- 98-6: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. Chen *et al.* [1995] (**antibody binding site definition and exposure**)
- 98-6: No neutralizing activity, positive ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC**, **enhancing activity**)
- 98-6: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 98-6: Preferentially recognizes oligomeric form of gp41 – enhanced binding to HIV-1 infected cells at 37 degrees relative to 4 degrees – addition of sCD4 enhances binding. Sattentau *et al.* [1995] (**antibody binding site definition and exposure**)
- 98-6: Epitope described as cluster II, 644-663, conformational – does not neutralize IIIB or synergize neutralization by anti-V3 MAb 447-52D or by CD4 BS MAbs. Laal *et al.* [1994] (**antibody binding site definition and exposure**, **antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 98-6: This MAb was expressed as a surface anti-gp41 monoclonal antibody receptor for gp41 on a CD4-negative B-cell line. Transfected cells could bind HIV Envelope, but could not be infected by HIV-1. When CD4 delivered by retroviral constructs was expressed on these cells, they acquired the ability to replicate HIV-1, and sIg/gp41 specifically enhanced viral replication. Tani *et al.* [1994]
- 98-6: Called SZ-98.6 – binds to a conformational domain within aa 644-663 of gp41, and reacts with astrocytes, as do 167-7 and ND-15G1. Eddleston *et al.* [1993] (**antibody binding site definition and exposure**)
- 98-6: Did not mediate deposition of complement component C3 on HIV infected cells, binding enhanced by sCD4. Spear *et al.* [1993] (**complement**)
- 98-6: No neutralizing or enhancing activity. Robinson *et al.* [1991] (**enhancing activity**)
- 98-6: Two fold increase in binding to gp120 in the presence of bound sCD4. Sattentau & Moore [1991] (**antibody binding site definition and exposure**)

- 98-6: Appeared to be specific for a conformational or discontinuous epitope. Xu *et al.* [1991] (**antibody binding site definition and exposure**)
- 98-6: No neutralizing or enhancing activity for HIV-1 IIIB. Robinson *et al.* [1990b] (**enhancing activity**)
- 98-6: Serves as target for antibody-dependent cellular cytotoxicity, ADCC. Tyler *et al.* [1990] (**ADCC**)
- 98-6: Kills HIV-infected cells when coupled to deglycosylated ricin A chain. Gorny *et al.* [1989] (**immunotoxin**)
- 98-6: Reacts preferentially with gp160 oligomer, compared to gp41 monomer. Pinter *et al.* [1989] (**antibody binding site definition and exposure**)
- 98-6: Toxic to HIV-infected T cells (H9) and monocytes (U937) when coupled to deglycosylated A chain of ricin. Till *et al.* [1989] (**immunotoxin**)

No. 772
MAb ID 167-7 (SZ-167.7)
HXB2 Location gp160 (644–663)
Author Location gp41 (644–663)
Epitope `SLIEESQNQQEKNEQELLEL`
Neutralizing
Immunogen HIV-1 infection
Species (Isotype) human (IgG2λ)
Ab Type gp41 cluster II
References Eddleston *et al.* 1993; Xu *et al.* 1991

- 167-7: Called SZ-167.7 – binds to a conformational domain within aa 644-663 of gp41, and reacts with astrocytes, as do 98-6 and ND-15G1. Eddleston *et al.* [1993]
- 167-7: Specific for a conformational epitope. Xu *et al.* [1991]

- 167-D: 167-D blocked 2F5 and 13H11 binding to gp41 epitopes to variable degrees. MAb 167-D showed strong binding to HIV-1-positive infected cells. Alam *et al.* [2008] (**antibody interactions**)
- 167-D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 167-D: Called 167. One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- 167-D: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – 98-6 binds to a C-HR hairpin epitope and blocks fusion when added to a 2 hour E/T preincubation at 31.5 C, but if added after 1 hour, doesn't inhibit – this is in contrast to six-helix bundle Abs 167-D and 1281 that inhibit more efficiently when added after one hour of incubation. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
- 167-D: This cluster II MAb binds to a conformational epitope in the region 644-663 – like most cluster II MAbs (126-6, 167-D, 1281, 1342, and 1379 all reacted similarly) it binds to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, but not to C43 nor to N51 alone. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 167-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 167-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reac-

B Cell

tivity – Clade D isolates bound most consistently to cluster II MAbs. Nyambi *et al.* [2000] (**subtype comparisons**)

- 167-D: No neutralizing activity, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC**, **enhancing activity**, **variant cross-recognition or cross-neutralization**)
- 167-D: Virions complexed to gp41 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 167-D: Did not mediate deposition of complement component C3 on HIV infected cells – complement mediated virolysis of MN and IIIB in the presence of sCD4. Spear *et al.* [1993] (**complement**)

Immunogen vaccine
HIV component: gp41
Species (Isotype) guinea pig
Ab Type gp41 MPER (membrane proximal external region)
References Joyce *et al.* 2002

- 2F5: DP178 is a peptide derived from the C-term heptad repeat of gp41 that is a potent inhibitor of viral-mediated fusion – it contains ELDKWA but fails to stimulate 2F5-like NAbs upon immunization – the peptide was extended to force an increase in helicity, and the modified peptide had a increase in affinity for 2F5, but upon guinea pig immunization although high peptide-specific Ab titers were achieved the sera were incapable of viral neutralization – the authors propose that 2F5 may be a low affinity maturation intermediate, which may account for its breadth and why it is hard to recreate the NAb response, but also suggests that the high concentrations required for neutralization are not relevant *in vivo*. Joyce *et al.* [2002]

Species (Isotype) goat (IgA, IgG)
References Dorosko *et al.* 2008
Keywords neutralization, vaccine antigen design

- Two goats were immunized with HIV-1 MPR 649-684 peptide to evaluate induction of MPR 649-684-specific Abs in goat colostrum and mature milk. Observable levels of MPR 649-684-specific IgA were detected in the colostrum of one animal, while the colostrum of both animals contained MPR 649-684-specific IgG Abs. IgG levels were higher than IgA levels. There were no MPR 649-684-specific Abs in the mature milk of the vaccinated animals, suggesting a rapid decline in Ab titers. Immunoprecipitated IgG and IgA showed varying and low level neutralization of free virus. Dorosko *et al.* [2008] (**neutralization**, **vaccine antigen design**)

- 2F5: UK Medical Research Council AIDS reagent: ARP3063.
- 2F5: NIH AIDS Research and Reference Reagent Program: 1475.
- 2F5: Neutralization susceptibility of CRF01_AE Env-recombinant viruses, derived from blood samples of Thai HIV-1 infected patients in 2006, was tested to 2F5. Approximately 40% of viruses tested showed high susceptibility to 2F5, including viruses with and without conserved 2F5 epitopes, suggesting that the susceptibility of CRF01_AE to 2F5 is not determined by the conservation of the core epitope sequence. Several X4R5 viruses were less susceptible to 2F5 compared with X4 or R5 viruses. There was no correlation observed between virus neutralization susceptibility to 2F5 and viral infectivity, the length of the gp120 variable regions, or the number of PNLG sites. Utachee *et al.* [2009] (**co-receptor**, **neutralization**, **subtype comparisons**)
- 2F5: 2F5 binding to gp41 was partially blocked by murine MAbs 5A9 and 13H11. 13H11 and the three cluster II human MAbs 98-6, 126-6 and 167-D blocked 2F5 binding to gp41 epitopes to variable degrees; the combination of 98-6 and 13H11 completely blocked 2F5 binding. MAb 2F5 showed strong binding to HIV-1-positive infected cells. Alam *et al.* [2008] (**antibody interactions**, **kinetics**, **binding affinity**)
- 2F5: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. Three different assays were used to analyze gp41-directed neutralizing activity. MAb 2F5 was shown to neutralize equivalently in the standard and post-CD4/CCR5 assay. Weak post-CD4/CCR5 neutralization was detected in five subtype B and two subtype C plasmas. 2F5 was shown to neutralize two of the MPER-engrafted mutant viruses, but the subtype B plasmas did not exactly recapitulate this activity. Neutralization of four subtype B plasmas was not inhibited by a 2F5 peptide. These results indicated that the anti-gp41 activity of the plasmas was probably not due to the presence of 2F5-like Abs. Binley *et al.* [2008] (**neutralization**, **subtype comparisons**)
- 2F5: This study explored features of Env that would enhance exposure of conserved HIV-1 epitopes. The changes in neutralization susceptibility, mediated by two mutations, T569A (in the HR1) and I675V (in the MPER), were unparalleled in their magnitude and breadth on diverse HIV-1 Env proteins. The variant with both TA and IV mutations was 2.8-fold more susceptible to b12, >180-fold more susceptible to 4E10, >780-fold more susceptible to sCD4 and resulted in 18-fold enhanced susceptibility to autologous plasma and >35-fold enhanced susceptibility to the plasma pool. It was also >360-fold more susceptible to 2F5. Mutant with only one IV mutation was >27-fold more susceptible to 2F5. Blish *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**)
- 2F5: Crystal structure of the heterodimeric complex of Ab2/3H6 Fab, an anti-idiotypic Ab, and 2F5 Fab, showed that the contacts between the Abs are predominantly made between the heavy chains of the two molecules. Mainly CDR-H3 of Ab2/3H6 forms contacts to 2F5 although residues from all three heavy-chain loops contribute to binding, interacting with a single linear ten amino acid sequence on the surface of 2F5. There is only a limited overlap between the parts of 2F5 recognized by Ab2/3H6 and those interacting with peptides derived from the linear gp41 epitope, but this overlap is sufficient to lead to steric competition between Ab2/3H6 and gp41. The results indicate that Ab2/3H6 is an anti-idiotypic Ab of the Ab2γ class, an Ab that does not carry the internal image of the linear primary gp41 2F5 epitope. Bryson *et al.* [2008] (**anti-idiotype**, **structure**)
- 2F5: Three constructs of the outer domain (OD) of gp120

B Cell

of subtype C, fused with Fc, were generated for immunization of mice: OD(DL3)-Fc (has 29 residues from the centre of the V3 loop removed), OD(2F5)-Fc (has the same deletion reconstructed to contain the sequence of 2F5 epitope), and the parental OD-Fc molecule. Only OD(2F5)-Fc construct reacted with 2F5. Sera from mice immunized with OD(2F5)-Fc showed low Ab titers, and no significant neutralization activity. Chen *et al.* [2008a] (**neutralization**, **vaccine antigen design**)

- 2F5: The goal of the study was to measure NAb responses in patients infected with HIV-1 prevalent subtypes in China. g160 genes from plasma samples were used to establish a pseudovirus-based neutralization assay. 2F5 neutralized 67% of subtype B clones and all subtype AE clones, but not subtype BC clones. Chong *et al.* [2008] (**neutralization**, **subtype comparisons**)
- 2F5: NMR structure of P1, a minimal MPER region that permits interaction with the mucosal galactosyl ceramide HIV-receptor, was analyzed in interaction with 2F5 at different pH. The best fit between NMR P1 and crystal structures of the Ab was at pH 6 and 5. The binding of 2F5 to P1 inserted into the liposomes of different compositions mimicking various biological membranes revealed 5- to 10-fold higher affinity of 2F5 to P1 in the lipid environment compared to aqueous environment, suggesting that specific lipid environment stabilizes the appropriate structure of the HIV-1 peptide. Coutant *et al.* [2008] (**kinetics**, **binding affinity**, **structure**)
- 2F5: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs, 2F5 in particular, and sCD4 were able to shift JR-FL trimers, In contrast, most non-neutralizing Fabs bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2F5: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. There was no difference in 2F5 binding to wild type and mutant JR-FL, and 2F5 inhibited infection of the two pseudoviruses with comparable potencies. Dey *et al.* [2008] (**binding affinity**)
- 2F5: Neutralization of HIV-1 BAL by 2F5 Ab was compared to neutralization capabilities of immunoprecipitated IgG and IgA Abs from the colostrum of two goats immunized with HIV-1 MPR 649-684 peptide. Immunoprecipitated IgG and IgA showed varying and low level neutralization of free virus, while the highest percent neutralization achieved by 2F5 was 24.9%. Dorosko *et al.* [2008] (**neutralization**)
- 2F5: The study examined whether elastin-like peptide (ELP) fusion technology is compatible with the production of MAb 2F5, which is a complex heteromultimeric pharmaceutical protein. ELP fusion to the light chain, heavy chain of both chains of a plant-derived antibody had no adverse effects on protein quality, but had a positive impact on the yield. Floss *et al.* [2008]
- 2F5: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied. Preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations were used. The epitopes for 2F5 and 4E10 were found to be exposed only on a form designed to mimic an prehairpin intermediate state during viral entry, which helps to explain the rarity of 2F5- and 2E10-like antibody responses. Frey *et al.* [2008] (**antibody binding site definition and exposure**, **binding affinity**)
- 2F5: This study describes an expression, purification and in vivo administration in guinea pigs of an anti-idiotypic HIV-1 vaccine based on murine anti-idiotypic MAb Ab2/3H6, which mimics the antigen recognition site of 2F5. Gach *et al.* [2008a] (**anti-idiotype**, **mimics**, **vaccine antigen design**)
- 2F5: This study describes the molecular features of murine anti-idiotypic MAb Ab2/3H6, which mimics the antigen recognition site of 2F5. Mice immunization with AB2/3H6 Fab variants elicited a specific 2F5-like humoral immune response. Gach *et al.* [2008b] (**anti-idiotype**, **mimics**, **vaccine antigen design**, **structure**)
- 2F5: The IC50 for 2F5 in a standard neutralization assay is 3.8nM but is increased 20-fold in the postattachment neutralization assay to 72nM. The neutralization half-life for 2F5 is 15 minutes but is increased 3-fold to 44 minutes in the presence of N36Mut(e,g), peptide, which is a class 3 inhibitor that prolongates temporal window of neutralization by disrupting trimerization of the N-heptad repeat (N-HR) in the prehairpin intermediate by sequestering the N-HR into N-HR/N36Mut(e,g) heterodimers. HXB2 was neutralized synergistically by 2F5 and N36Mut(e,g), where the formation of N-HR/N36Mut(e,g) heterodimers enhances the probability of 2F5 binding and the binding of 2F5 enhances the probability of N-HR/N36Mut(e,g) heterodimer formation, greatly diminishing the probability of 6-helix bundle formation. Gustchina *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **kinetics**)
- 2F5: This review summarizes the obstacles that stand in the way of making a successful preventive HIV-1 vaccine, such as masked or transiently expressed Ab epitopes, polyclonal B-cell class switching, and inefficient, late, and not sufficiently robust mucosal IgA and IgG responses. Possible reasons why HIV-1 envelope constructs expressing 2F5 epitope fail to induce broadly neutralizing Abs are discussed. Haynes & Shattock [2008] (**vaccine antigen design**, **review**)
- 2F5: Synergy of 2F5 with MAbs 2G12, D5, and peptide C34 was examined. 2F5 exhibited synergy in inhibition of HIV-1 89.6 with MAb 2G12, D5 and peptide C34. In combination with a matured D5 variant (2-75), the synergistic effect was increased. D5 and 2F5 contributed equally to the observed synergy. It is suggested that 2F5 and D5 have complementary roles, binding to distinct but adjacent Env trimers on the same virion, thereby synergistically preventing formation of fusion pores. Hrin *et al.* [2008] (**antibody interactions**)
- 2F5: A MPER peptide, AISpreTM, overlapping 2F5 and 4E10 epitope sequences, was capable of breaching the permeabil-

B Cell

ity barrier of lipid vesicles. 2F5 blocked the peptide bilayer-destabilizing activity, whether the lipid composition contained cholesterol or sphingomyelin raft-lipids, indicating that the lipid composition of the membrane has a less pronounced effect on the 2F5 inhibitory activity. The 2F5 epitope appears to remain anchored to the water-membrane interface and is more accessible for Ab binding under different membrane lipid conditions. Huarte *et al.* [2008a] (**antibody binding site definition and exposure**)

- 4E10: The study compared the in-membrane recognition and blocking activity of the 2F5 and 4E10 MAbs, using solution-diffusing, unstressed phospholipid vesicles with sizes that approximate to that of the HIV virion, and an MPER-derived sequences that combines the full length 2F5 and 4E10 epitopes. 2F5 MAb had lower affinity for membrane-bound species than 4E10 MAb, as defined by inhibition data together with direct electron microscopy and flow cytometry determination of the vesicle-antibody association. Huarte *et al.* [2008b]
- 2F5: Eight 2F5 Fab' crystal structures, free and in complex with various gp41 peptide epitopes, revealed several key features of Ab-antigen interaction. The extended complementarity-determining region (CDR) H3 loop is mobile, both in ligand-free and epitope-bound forms. The interaction between 2F5 and the ELDKWA epitope core is critical, and there are also close and specific contacts with residues located N-terminal to the core, while the residues located at the C-terminus of the core do not interact as tightly with the Ab. In the presence of a larger peptide, these C-terminus residues adopt a conformation consistent with the start of an α helix. At the base of the CDR H3, a sulfate ion is present near residue Arg100H, that might be mimicking the negatively charged phosphate of a lipid headgroup representing a possible site of interaction between 2F5 and the phospholipid bilayer. Julien *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- 2F5: Similarity level of the 2F5 binding site pentapeptide LDKWA to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 1 time, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- 2F5: A mathematical model was developed and used to derive transmitted or founder Env sequences from individuals with acute HIV-1 subtype B infection. All of the transmitted or early founder Envs were sensitive to neutralization by 2F5, but there was a modest heightened resistance of acute Envs compared to chronic Envs to neutralization by 2F5. Keele *et al.* [2008] (**neutralization**, **acute/early infection**)
- 2F5: CTB-MPR649-684 (cholera toxin subunit B and residues 649-684 of gp41 MPER region) peptide was developed for vaccine studies in rabbits. 2F5 affinity to the CTB-MPR peptide was equivalent to 2F5 affinity toward an MPR peptide, indicating that the fusion peptide presented antigenically competent MPR. Sera from immunized rabbits displayed no neutralizing activity, but could inhibit epithelial transcytosis of virus, indicating elicitation of non-neutralizing Abs capable of stopping mucosal transmission and infection of target cells. Matoba *et al.* [2008] (**binding affinity**)
- 2F5: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. In addition, 2F5 inhibited transmission of CCR5-tropic viruses while transmission of 2F5-neutralized X4 variants increased, indicating that X4 HIV-1 has an advantage over R5 in transmission when neutralized with 2F5. The increase in transmission of X4 viruses is probably mediated by increase in capture, as X4 HIV-1 capture increased twofold upon 2F5 neutralization, while neutralization by 2F5 had no effect on capture of R5 viruses. Capture analysis of different HIV-1 molecular clones showed that neutralization by 2F5 increased transmission of only X4 and late R5X4 variants with a higher V3 charge. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)
- 2F5: 2F5 was shown to bind to Envs used in typical epitope binding assays, unlike the neutralizing Abs 8K8, DN9, and D5 used in this study. Nelson *et al.* [2008]
- 2F5: Contemporaneous biological clones of HIV-1 were isolated from plasma of chronically infected patients and tested for their functional properties. The clones showed striking functional diversity both within and among patients, including differences in infectivity and sensitivity to inhibition by 2F5. There was no correlation between clonal virus infectivity and sensitivity to 2F5 inhibition, indicating that these properties are dissociable. The sensitivity to 2F5 inhibition was, however, a property shared by viruses from a given patient, suggesting that the genetic determinants that define this sensitivity may lie in regions that are not necessarily subject to extensive diversity. Nora *et al.* [2008] (**neutralization**)
- 2F5: Two HIV-1 isolates, NL4-3 and KB9, were adapted to replicate in cells using the common marmoset receptors CD4 and CXCR4. The adaptation resulted in a small number of changes of env sequences in both isolates. The adapted NL4-3 variants were equally sensitive to neutralization by 2F5 as the adapted KB9 variants. Some of the NL4-3 and KB9 variants exhibited increased sensitivity to neutralization by 2F5 compared to the wildtype isolates. Pacheco *et al.* [2008] (**neutralization**)
- 2F5: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. 2F5 was used as control in neutralization assays, and was able to neutralize JR-FL isolate, and with lower potency, SF162. A chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. Patel *et al.* [2008] (**neutralization**)
- 2F5: For assessment of gp41 immunogenic properties, five soluble GST-fusion proteins encompassing C-terminal 30, 64, 100, 142, or 172 (full-length) amino acids of gp41 ectodomain were generated from M group consensus Env sequence. All five protein fragments were equally recognized by 2F5 indicating that the 2F5 epitope is conformationally similar and equally exposed. Patients considered as slow progressors generally exhibited greater Ab reactivity against the 30aa fragment, indicating that these Abs target MPER region and exhibit 2F5- and 4E10-like properties. Plasma from these pa-

B Cell

tients also exhibited broader and more potent neutralizing activity against several HIV-1 isolates. Plasma from 8 of 44 patients reacted with peptides that bind 2F5, indicating that these patients mounted 2F5-like Ab response. Penn-Nicholson *et al.* [2008] (**rate of progression**)

- C2F5: Neutralization of HIV-1 IIIB LAV isolate by 2F5 was within the same range as the neutralization of the virus by natural antibodies from human sera against the gal(α1,3)gal disaccaride linked to CD4 gp120-binding peptides, indicating that the activity of natural antibodies can be re-directed to neutralize HIV-1. Perdomo *et al.* [2008] (**neutralization**)
- 2F5: The sensitivity of R5 envelopes derived from several patients and sevaral tissue sites, including brain tissue, lymph nodes, blood, and semen, was tested to a range of inhibitors and Abs targeting CD4, CCR5, and various sites on the HIV envelope. All but one envelope from brain tissue were macrophage-tropic while none of the envelopes from the lymph nodes were macrophage-tropic. Macrophage-tropic envelopes were also less frequent in blood and semen. There was no clear correlation between macrophage-tropism and neutralization sensitivity to 2F5, indicating that variation in macrophage tropism is not caused by variation in the membrane proximal region of Env. Peters *et al.* [2008b] (**brain/CSF**, **macrophage**, **neutralization**)
- 2F5: This minireview summarizes data on differences in neutralizing activities of MAbs and pooled human sera using a traditional primary cell neutralization assay and the more standardized TZM-bl reporter cell line assay. Also, suggestions are made on how to improve and standardize neutralization assays for comparable use in different laboratories. 2F5 neutralization was tested against a panel of 60 HIV-1 primary isolates (10 each from clades A-D, CRF01_AE and CRF02_AG) in the two assays. 13 viruses from the PBMC assay and 9 viruses from the TZM-assay were not neutralized by this Ab (including subtype C in both assays). In total, the assay discordances were shown to be bi-directional and not attributable to assay sensitivity. Polonis *et al.* [2008] (**neutralization**, **review**, **subtype comparisons**, **assay standardization/improvement**)
- 2F5: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to 2F5, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. D1/85.16 isolate was moderately (6-fold) more sensitive to 2F5 neutralization than the parental isolate, while CC101.19 was not. As D1/85.16 escape mutant had a polymorphism in the first position of the 2F5 epitope (Aldkwas), this sequence change might be responsible for its modest increase in the 2F5 neutralization sensitivity. Overall, the study suggests that CCR5 inhibitor-resistant viruses are likely to be somewhat more sensitive to neutralization than their parental viruses. Pugach *et al.* [2008] (**co-receptor**, **neutralization**, **escape**)
- 2F5: Quaternary structure of gp41 helical domains N-HR and C-HR was mimicked by 3α N-HR and 3α C-HR mimetic proteins consisting of covalently linked trimeric coiled-coil bundle, which is a truncated version of the gp41 prehairpin. The 3α mimetics were immunogenic and elicited Abs in guinea pigs specific for gp41. The sera from immunized animals neutralized viral R5 and X4-tropic viruses at 31.5 degrees C, but not under standard assay conditions, in which 2F5 blocked HIV-1 infection. Sadler *et al.* [2008] (**neutralization**)
- 2F5: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. 2F5 recognized both B and C trimers, indicating that the 2F5 epitope was exposed and preserved in the subtype C trimers. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)
- 2F5: The MPER region was shown to have an L-shaped structure, with the conserved C-terminal residues immersed in the membrane and the variable N-terminal residues exposed to the aqueous phase. The specific binding of 2F5 to the MPER was comparable to that of 4E10, with little or no binding to the membrane alone. It is suggested that 2F5, like 4E10, extracts its epitope from the viral membrane, and that the key requirement for neutralization is induction of structural rearrangement of the MPER hinge by the Ab. It is also suggested that exposure of the membrane-embedded residues of the MPER region to the immune system in their native L-shaped form may elicit neutralizing Abs. Sun *et al.* [2008] (**antibody binding site definition and exposure**)
- 2F5: The neutralization profile of early R5, intermediate R5X4, and late X4 viruses from a rhesus macaque infected with SHIV-SF162P3N was assessed. 2F5 neutralized the late X4 virus, and to some extent the parental R5 virus, but did not neutralize the R5X4 intermediate. A K to N mutation within the 2F5 epitope in the R5X4 intermediate accounted for its neutralization resistance. Tasca *et al.* [2008] (**co-receptor**, **neutralization**, **escape**)
- 2F5: To investigate B-cell responses immediately following HIV-1 transmission, env-specific Ab responses to autologous and consensus Envs in plasma donors were determined. Broadly neutralizing Abs with specificity similar to 2F5 did not appear during the first 40 days after plasma virus detection. Tomaras *et al.* [2008] (**acute/early infection**)
- 2F5: 2F5 reacted with maltose-binding proteins MBP30 and MBP32, containing both HR1 and HR2 domains of gp41, and with MBP37 and MBP44, containing only the HR2 domain, but not with MBP-HR1, containing only the HR1 domain. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)
- 2F5: The various effects that neutralizing and non-neutralizing anti-envelope Abs have on HIV infection are reviewed, such as Ab-mediated complement activation and Fc-receptor mediated activities, that both can, through various mechanisms, increase and decrease the infectivity of the virus. The importance of these mechanisms in vaccine design is discussed. The unusual features of the 2F5 MAb, and its neutralizing activities, are described. Willey & Aasa-Chapman [2008] (**neutralization**, **review**)
- 2F5: Current insights into CTLs and NAbs, and their possible protective mechanisms against establishment of persistent

B Cell

HIV/SIV infection are discussed. Pre- and post-infection sterile and non-sterile protection of NAbs against viral challenge, and potential role of NAbs in antibody-mediated antigen presentation in modification of cellular immunity, are reviewed. Use of 2F5 in immunization experiments and its in vivo antiviral activity in suppression of viral rebound in HIV-1 infected humans undergoing structured treatment interruptions are described. Yamamoto & Matano [2008] (**immunotherapy**, **supervised treatment interruptions (STI)**, **review**)

- 2F5: The newly detected mAb m44 was shown to neutralize a subtype C SHIV strain more potently than 2F5. In binding assays, 2F5 did not bind to 5Hb region. 2F5 did not compete with m44 for binding. A fusion protein of gp41 constructed for alanine-scanning mutagenesis bound to 2F5, indicating that its antigenic structure was intact. Five alanine mutations in the C-HR region (M94, W96, M97, R101, and I103) affected binding of 2F5 to gp41. 2F5 bound to self antigens in lipid binding assays. Zhang *et al.* [2008] (**neutralization**, **binding affinity**)
- 2F5: The autoantibody nature of the two membrane proximal HIV-1 neutralizing antibodies, 2F5 and 4E10, was evaluated by comparison to human anti-cardiolipin MAbs derived from a primary antiphospholipid syndrome patient. Both 2F5 and 4E10 bound specifically to cardiolipin. CDR3 sequence similarities between 2F5, 4E10 and anti-cardiolipin MAbs were observed. Both 2F5 and 4E10 binding to the peptide-lipid conjugate was best fit by a two-step conformational change model. These results suggest that these MAbs share binding and structural similarities with human autoantibodies and their induction by vaccines or natural infection therefore might be limited by immune tolerance mechanisms. Alam *et al.* [2007] (**antibody sequence variable domain**)
- 2F5: Sera from rabbits immunized with either monomeric gp120, trimeric cleavage-defective gp140 or disulfide-stabilized soluble trimeric gp140 were tested for neutralization of chimeric SIVmac239 viruses expressing epitope for this Ab. Little or no neutralization was observed indicating that little or no Ab activity in these rabbit sera was directed against the gp41 region. Beddows *et al.* [2007] (**neutralization**, **vaccine antigen design**)
- 2F5: Pseudoviruses derived from gp120 env variants that evolved in multiple macaques infected with SHIV 89.6P displayed a range of degrees of virion-associated Env cleavage. Pseudoviruses with higher amount of cleaved Env were more resistant to neutralization by 2F5. The gp41 sequence was the same in all pseudoviruses, indicating that changes in gp120 can mediate sensitivity of gp41 to neutralization. Blay *et al.* [2007] (**neutralization**)
- 2F5: 7/15 and 9/15 subtype A HIV-1 envelopes from samples taken early in infection were neutralized by MAbs 4E10 and 2F5, respectively, and the potency was generally modest. Mutational patterns in the MAb binding sites did not readily explain the observed patterns of sensitivity and resistance. Blish *et al.* [2007] (**neutralization**, **variant cross-recognition or cross-neutralization**, **acute/early infection**, **subtype comparisons**)
- 2F5: No differences in neutralization sensitivity between (R5)X4 and R5 viruses obtained early and late after X4 emergence were observed. Bunnik *et al.* [2007] (**co-receptor**, **neutralization**)
- 2F5: Spread of HIV-1 through formation of virological synapses (VS) between infected and uninfected T-cells was shown to require Env-CD4 receptor interactions. Treatment of cells with 2F5 did not block VS-mediated transfer, indicating that VS-mediated transfer is not dependent on activation of viral membrane fusion. 2F5 at the same or lower concentrations blocked cell-free infection. Chen *et al.* [2007b] (**neutralization**)
- 2F5: 2F5, 4E10, and m46 neutralization was more potent when tested in a HeLa cell line expressing low CCR5 than in a HeLa cell line expressing high CCR5 levels. PBMC tend to have low CCR5 expression. Choudhry *et al.* [2007] (**co-receptor**, **neutralization**, **assay standardization/improvement**)
- 2F5: 2F5 bound with slower on-rates and faster off-rates to the SF162gp140 and ΔV2gp140 proteins than the anti-gp41MAbs P4A3 and P4C2, but in contrast to the anti-gp41 MAbs, it neutralized the SF162 virus. Thus, differences in neutralization potency could not be explained by differing kinetics. Derby *et al.* [2007] (**neutralization**, **kinetics**, **binding affinity**)
- 2F5: SOSIP Env proteins are modified by the introduction of a disulfide bond between gp120 and gp41 (SOS), and an I559P (IP) substitution in gp41, and form trimers. The KNH1144 subtype A virus formed more stable trimers than did the prototype subtype B SOSIP Env, JRFL. The stability of gp140 trimers was increased for JR-FL and Ba-L SOSIP proteins by substituting the five amino acid residues in the N-terminal region of gp41 with corresponding residues from KNH1144 virus. b12, 2G12, 2F5, 4E10 and CD4-IgG2 all bound similarly to the WT and to the stabilized JRFL SOSIP timers, suggesting that the trimer-stabilizing substitutions do not impair the overall antigenic structure of gp140 trimers. Dey *et al.* [2007a] (**vaccine antigen design**)
- 2F5: Chimeric SIV viruses containing 2F5 and 4E10 epitopes were not neutralized by broadly neutralizing sera from two clade B and one clade A infected asymptomatic individuals, indicating that MPER NAb epitopes did not account for the broad neutralizing activity observed. Dhillon *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**)
- 2F5: Kinetics experiments of 2F5 binding to MPER region during viral fusion showed that the 2F5 kinetics resembled those of the six-helix bundle formation and fusion blocker C34, indicating that the function of MPER in the fusion cascade is still in effect at a late stage in the fusion reaction. Binding of 2F5 was shown to decrease upon triggering HIV-1 Env-expressing cells with appropriate target cells and addition of C34 did not counteract this loss, suggesting that changes in exposure of MPER occur independently of the six-helix bundle formation. Dimitrov *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **kinetics**, **binding affinity**)
- 2F5: A D386N change in the V4 region, which results in restoration of N-glycosylation at this site, did not have any impact on the neutralization of a mutant virus by 2F5 compared to wildtype. Also, there was no association between increased

B Cell

sensitivity to 2F5 neutralization and enhanced macrophage tropism. Dunfee *et al.* [2007] (**neutralization**)

- 2F5: Newborn macaques were challenged orally with the highly pathogenic SHIV89.6P and then treated intravenously with a combination of IgG1b12, 2G12, 2F5 and 4E10 one and 12 hours post-virus exposure. All control animals became highly viremic and developed AIDS. In the group treated with mAbs 1 hour post-virus exposure, 3/4 animals were protected from persistent systemic infection and one was protected from disease. In the group treated with mAbs 12 hour post-virus exposure, one animal was protected from persistent systemic infection and disease was prevented or delayed in two animals. IgG1b12, 2G12, and 4E10 were also given 24 hours after exposure in a separate study; 4/4 treated animals become viremic, but with delayed and lower peak viremia relative to controls. 3/4 treated animals did not get AIDS during the follow up period, and 1 showed a delayed progression to AIDS, while the 4 untreated animals died of AIDS. Thus the success of passive immunization with NAbs depends on the time window between virus exposure and the start of immunoprophylaxis. Ferrantelli *et al.* [2007] (**immunoprophylaxis**)
- 2F5: An anti-idiotypic mouse Ab (Ab2/3H6) against MAb 2F5 was partially humanized, expressed and characterized for its interactions with 2F5. The recombinantly expressed variants of Ab2/3H6 were able to bind to the paratope of 2F5 and also significantly inhibit binding of 2F5 to its epitope. All recombinant Ab2/3H6 were also able to inhibit the neutralization of HIV-1 isolate RF by 2F5. Gach *et al.* [2007] (**anti-idiotype**, **neutralization**, **binding affinity**)
- 2F5: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to 2F5 and other MAbs. Antibodies induced by immunization with these centralized proteins did not, however, have the breadth and potency compared to that of 2F5 and other broadly neutralizing MAbs. 2F5 physical characteristics of autoantibodies as a possible reason for lack of 2F5 broad production is also discussed. Gao *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- 2F5: The potency of 2F5 was 25-fold higher than the potency of new neutralizing Fab 3674 in neutralization of laboratory and primary strains of HIV-1 subtypes A, B and C. Gustchina *et al.* [2007] (**neutralization**, **subtype comparisons**)
- 2F5: Using sychronously infected cell cultures, the binding of b12, 2F5 and 2G12 to the cell-free virus interferes with a step of infection subsequent to cell attachment. HIV escape from b12 ocurred 30 and 10 min before escape from 2F5 for IIIB infection of HeLa cells and JRFL infection of Cf2Th-CD4/CCR5 cells, respectivelly, indicating that neutralization efficiency is determined by the time frames during which Ab can bind to the receptor-activated envelope proteins during the entry phase. 2F5 neutralization was enhanced by a decreasing the rate of coreceptor CXCR4 engagement, presumably by increasing the time the CD4 bound Env was available and slowing viral entry kinetics. Haim *et al.* [2007] (**co-receptor**, **kinetics**)
- 2F5: HIV-1 env clones resistant to cyanovirin (CV-N), a carbohydrate binding agent, showed amino acid changes that resulted in deglycosylation of high-mannose type residues in the C2-C4 region of gp120. Compared to their parental virus HIV-1 IIIB, these resistant viruses maintained similar sensitivity to 2F5. Hu *et al.* [2007] (**neutralization**, **escape**)
- 2F5: Binding of 2F5 to gp41 was not significantly affected by the small molecule HIV-1 entry inhibitor IC9564. IC9564 induces conformational change of gp120 to allow CD4i antibody 17b to bind, but inhibits CD4-induced gp41 conformational changes. Huang *et al.* [2007b] (**antibody binding site definition and exposure**)
- 2F5: This review summarizes current knowledge on the various functional properties of antibodies in HIV-1 infection, including 2F5 mAb, in vivo and in vitro activity of neutralizing Abs, the importance and downfalls of non-neutralizing Abs and antibodies that mediate antibody-dependent cellular cytotoxicity and the complement system, and summarizes data on areas tht need future investigation on Ab-mediated immune control. Huber & Trkola [2007] (**review**)
- 2F5: To test the immunogenicity of three molecularly engeneered gp41 variants on the cell surface their reactivity with 2F5 was assessed. The reactivity of 4cSSL24 variant was comparable to gp160 while the other two variants showed somewhat lower expression levels. When guinea pigs were immunized with the three variants, the level of the specific anti-gp41 Ab responses was low with the anti-gp41 response preferentially directed to the C-helical domain, away from the MPER region. Kim *et al.* [2007] (**vaccine antigen design**, **binding affinity**)
- 2F5: A new high throughput method was developed for neutralization analyses of HIV-1 env genes by adding cytomegalovirus (CMV) immediate enhancer/promoter to the 5' end of the HIV-1 rev/env gene PCR products. The PCR method eliminates cloning, transformation, and plasmid DNA preparation steps in the generation of HIV-1 pseudovirions and allows for sufficient amounts of pseudovirions to be obtained for a large number of neutralization assays. Pseudovirions generated with the PCR method showed similar sensitivity to 2F5 Ab, indicating that the neutralization properties are not altered by the new method. Kirchherr *et al.* [2007] (**assay development**, **neutralization**)
- 2F5: Four consensus B Env constructs: full length gp160, uncleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective uncleaved version mediated infection using the CCR5 co-receptor. Primary isolate Envs varied between completely resistant or somewhat sensitive to neutralization by membrane proximal Nabs 4E10 and 2F5. The most sensitive Con B construct was the truncated version of Con B Env with a stop codon immediately following the membrane spanning domain, suggesting that truncation of the gp41 cytoplasmic domain facilitates greater accessibility of the MPER region. The Con B gp160 was quite resistant, and the gp160-201N/S more sensitive, to 4E10 and 2F5. Kothe *et al.* [2007] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)
- 2F5: Viruses from 304 days and at 643 days (time of death) post-infection of a macaque infected with SHIV SF162P4

B Cell

were resistant to contemporaneous serum that had broadly reactive NAbs. While resistance to anti-V3, b12, and anti-V1 MAbs developed over time, viruses remained senstitive to 2F5 and 2G12. Kraft *et al.* [2007] (**neutralization**, **escape**)

- 2F5: This review summarizes 2F5 Ab epitope, properties and neutralization activity. 2F5 use in passive immunization studies in primates and possible mechanisms explaining protection against infection are discussed. Also, 2F5 autoreactivity and its implications for active immunizations are discussed. Kramer *et al.* [2007] (**immunotherapy**, **review**)
- 2F5: High levels of gp120-specific Abs were elicited when mice and rabbits were immunized by DNA priming and protein boosting with G1 and G2 grafts, consisting of 2F5 and 4E10 epitopes, respectivelly, engrafted into the V1/V2 region of gp120. A consistent NAb response against the homologous JR-FL virus was detected in rabbits but not in mice. 4E10 bound to the engrafted construct, but embedding the MPER epitopes in the immunogenic V1/V2 region did not result in eliciting anti-MPER antibodies in mice or rabbits. 2F5 bound to the Graft1 antigen consisting of 2F5 and 4E10 epitopes engrafted into the immunogenic V1/V2 region of gp120 much more weakly than to gp41 suggesting that the 2F5 epitope might be hidden or folded incorrectly in this construct. Law *et al.* [2007] (**vaccine antigen design**)
- 2F5: 2F5 structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit anti-gp41 Abs, are reviewed in detail. The effect of the autoreactivity of 2F5 on vaccine antigen design is discussed. Lin & Nara [2007] (**vaccine antigen design**, **review**, **structure**)
- 2F5: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, a summary of the neutralizing activity of mAb 2F5 in different HIV-1 clades is provided. McKnight & Aasa-Chapman [2007] (**variant cross-recognition or cross-neutralization**, **review**)
- 2F5: Three MAbs, 2G12, 4E10 and 2F5, were administered to ten HIV-1 infected individuals treated with ART during acute and early infection, in order to prevent viral rebound after interruption of ART. MAb infusions were well tolerated with essentially no toxicity. Viral rebound was not prevented, but was significantly delayed in 8/10 patients. 2G12 activity was dominant among the MAbs used. Antiviral activity of 2F5 was not clearly demonstrated. Development of resistance to 2F5 was not observed despite ongoing viral replication. Plasma HIV-1 RNA levels did not increase following cessation of Ab infusion. Plasma viremia was essentially identical between patients not receiving MAb therapy and patients receiving 4E10 and 2F5 in the face of 2G12 resistance. 2F5 also failed to accumulate with repeated infusions in patient plasma. Long-term suppression of viremia was achieved in 3/10 patients. Mehandru *et al.* [2007] (**escape**, **immunotherapy**, **supervised treatment interruptions (STI)**)
- 2F5: HIV-1 neutralized with 2F5 was shown to be more efficiently captured by immature monocyte-derived DCs (iMDDCs) and DC-SIGN-expressing Raji cells than nonneutralized virus. 2F5-neutralized virus captured by these cells was successfully released and transferred to CD4+ T lymphocytes. The released virus could be re-neutralized by 2F5 before infecting CD4+ T cells, indicating that Ab-HIV-1 complex is separated upon capture by DC-SIGN cells. Capture of 2F5-neutralized virus was inhibited by blocking Fc receptors and DC-SIGN on iMDDCs, indicating significant role of DC-SIGN, and a partial role of Fc receptors, in the Ab-enhanced capture of HIV-1. van Montfort *et al.* [2007] (**enhancing activity**, **neutralization**, **dendritic cells**)
- 2F5: Z13e1, a high affinity variant of Fab Z13, was identified through targeted mutagenesis and affinity selection against gp41 and an MPER peptide. Z13e1 showed 100-fold improvement in binding affinity for MPER antigens over Z13, but was still less potent than 4E10 at neutralizing several pseudotyped Envs. Neutralization assays of HIV-1 JR2 MPER alanine mutants showed that mutants W666A and W672A were completely resistant to neutralization by 2F5. Nelson *et al.* [2007] (**antibody binding site definition and exposure**)
- 2F5: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. 2F5 structure and binding to HIV-1 envelope and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, such as 2F5, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- 2F5: The ability of 2F5 to neutralize recently transmitted viruses was examined in four homosexual and two parenteral transmission pairs. The vast majority of recently transmitted viruses from 3/4 homosexual recipients were sensitive to neutralization by 2F5, although viruses isolated later in the course of infection showed increased sensitivity to 2F5 in the patient with early viruses resistant to 2F5 neutralization. In the parenteral transmission, one of the recipients had early viruses resistant to 2F5 neutralization, and one had viruses sensitive to 2F5 neutralization. The neutralization sensitivity patterns of recipient viruses to 2F5 did not correlate to the neutralization sensitivity patterns of their donors in the homosexual couples, while the HIV-1 variants from the parenteral pairs were similarly resistant/sensitive to neutralization by 2F5. Despite variations in 2F5 sensitivity, none of the viruses had mutations in the crucial DKW residues of the 2F5 epitope. Quakkelaar *et al.* [2007b] (**neutralization**, **acute/early infection**, **mother-to-infant transmission**)
- 2F5: This study found that, contrary to expectations, the viruses resistant to b12, 4E10, 2G12 and 2F5 neutralization did not have lower replication kinetics than viruses sensitive to neutralization. Viruses from early infection tended to have relatively low replications rates. Quakkelaar *et al.* [2007a] (**viral fitness and reversion**, **acute/early infection**, **escape**)
- 2F5: 2F5 was produced in transgenic tobacco BY2 suspension cell cultures. The plant derived antibody was efficiently assembled and intact. When compared to CHO-derived 2F5, the plant derived 2F5 showed similar kinetic properties and 89% of the binding capacity of the CHO-derived Ab. However, it was only 33% as efficient in HIV-1 RF neutralization assay. Sack *et al.* [2007] (**neutralization**, **binding affinity**)

B Cell

- 2F5: A reference panel of recently transmitted Tier 2 HIV-1 subtype B envelope viruses was developed representing a broad spectrum of genetic diversity and neutralization sensitivity. The panel includes viruses derived from male-to-male, female-to-male, and male-to-female sexual transmissions, and CCR5 as well as CXCR4 using viruses. The envelopes displayed varying degrees of neutralization sensitivity to 2F5, with 14 of 19 enevlopes sensitive to neutralization by this Ab. Schweighardt *et al.* [2007] (**neutralization**, **assay standardization/improvement**)
- 2F5: Infusion of a MAb cocktail (4E10, 2G12 and 2F5) into HIV-1 infected subjects was shown to be associated with increased levels of serum anti-cardiolipin and anti-phosphatidylserine Ab titers, and increased coagulation times. In the absence or in the presence of adult and neonate plasma, 2F5 exhibited low binding to phosphatidylserine, did not bind to cardiolipin, and did not induce significant prolongations of clotting times in human plasma, indicating that infusion of 2F5 was not responsible for autoreactivity and prolonged clotting times. Vcelar *et al.* [2007] (**antibody interactions**, **autoantibody**, **binding affinity**, **immunotherapy**)
- 2F5: Novel approaches based on sequential (SAP) and competitive (CAP) antigen panning methodiologies, and use of antigens with increased exposure of conserved epitopes, for enhanced identification of broadly cross-reactive neutralizing Abs are reviewed. Previously known broadly neutralizing human mAbs are compared to Abs identified by these methods. Zhang & Dimitrov [2007] (**review**)
- 2F5: This review summarizes current knowledge of HIV-1 lipid-protein interactions and antibodies to liposomal phospholipids and cholesterol. A potential use of Abs to lipids to neutralize HIV-1 and a potential role of the broadly neutralizing HIV-1 Abs, mainly 2F5 and 4E10, in binding to phospholipids is discussed. Alving *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**, **review**)
- 2F5: Inhibition of 2F5 binding to gp160 by 2F5-like Abs in sera from long-term non-progressors (LTNP) was determined. 2F5-like Abs were present in almost all sera from LTNPs but at a lower levels than b12. No statistically significant correlation was found for the specificity of this Ab comparing sera able to neutralize all four HIV-1 strains and sera that could not. Braibant *et al.* [2006] (**enhancing activity**, **neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2F5: The majority of broadly cross-reactive neutralizing (BCN) Envs were neutralized at lower concentrations of 2F5 than the non-BCN Envs. Amino acid variability of the 2F5 epitope was examined. The presence of T at position 662 was associated with increased sensitivity to neutralization by 2F5 while the K665N mutation resulted in resistance to 2F5 Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **escape**, **subtype comparisons**)
- 2F5: Neutralization of HIV-1 primary isolates of different HIV-1 clades (A, B, C, D, E) by 2F5 was determined in cells expressing high or low surface concentrations of CD4 and CCR5 receptors. CD4 cell surface concentration had no effect on the inhibitory activity of this Ab while the CCR5 surface concentration had a significant effect decreasing the 50% inhibitory concentration of 2F5 in cell lines with low CCR5. Choudhry *et al.* [2006] (**co-receptor**, **neutralization**, **variant cross-recognition or cross-neutralization**)
- 2F5: Neutralization rates and rate constants for the neutralization of clade B primary isolates SF33, SF162 and 89.6 by this Ab were determined. Statistically significant neutralization was not observed for isolates SF162 and 89.6. It was shown that neutralization sensitivity is not associated with neutralization of cell-associated or free virus. Davis *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **kinetics**)
- 2F5: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). 2F5 recognized all four gp140 proteins equally. 2F5 was found to equally neutralize SF162 and Δ2F5.4E10, which is a virus with mutations in the 2F5 and 4E10 epitopes and is resistant to neutralization by 2F5 and 4E10. This indicates that 2F5-like Abs were not present in sera from the gp140-immunized animals nor in the SHIV-infected and in the HIVIG sera. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **antibody generation**, **neutralization**)
- 2F5: Genetic variability and co-variation of the mAb 2F5, 4E10 and Z13 epitopes in B and non B clades was investigated. A significant shift in the predominant sequence patterns over time was observed for all three epitopes. Also, significant inter-subtype genetic variability of the three epitopes was detected. However, the 4E10 epitope displayed a more similar variability within B clade and non-B clades, concurring with the cross-clade neutralizing activity of this mAb. Epitope co-variation was also noted, as one third of the recently isolated HIV-1 strains displayed simultaneous epitope variants. Dong & Chen [2006] (**antibody binding site definition and exposure**, **subtype comparisons**)
- 2F5: Env-pseudotyped viruses were constructed from the gp160 envelope genes from seven children infected with subtype C HIV-1. 2F5 failed to neutralize any of the seven viruses, correlating with the replacement of the crucial lysine at the position 665 of the 2F5 epitope on these viruses. When this Ab was mixed with IgG1b12 and 2G12, the neutralization was similar as to IgGb12 alone, indicating that the majority of the pool activity was due to IgG1b12. When 4E10 was added to this mix, all isolates were neutralized. Gray *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **responses in children**, **mother-to-infant transmission**)
- 2F5: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**, **escape**, **review**, **subtype comparisons**, **structure**)

B Cell

- 2F5: Viruses with cleavage-competent 2G12-knockout Env and cleavage-defective Env able to bind 2G12 were constructed. 2F5 was shown to bind more to the cleavage-defective Envs than to the cleavage-competent Envs. More 2F5 binding was detected to cells co-expressing wildtype and leavage-defective Env than to a mixture of cells expressing either, suggesting that uncleaved Env proteins have an enhancing effect of the binding of 2F5 to the heterotrimer or that fewer than three Abs can bind per trimer and that 2F5 has a higher affinity for the uncleaved Env. Env pseudotyped virions bearing either Wt3.2P(+)gp140δct Env or a mixture of the wildtype and cleavage-defective Env had similar sensitivities to neutralization by 2F5. Herrera *et al.* [2006] (**neutralization**, **binding affinity**)
- 2F5: Inhibition of R5 HIV replication by monoclonal and polyclonal IgGs and IgAs in iMDDCs was evaluated.The neutralizing activity of 2F5 was observed to be higher in iMDDCs than in PBLs and PHA-stimulated PBMCs. Furthermore, the kinetics of Ab addition showed that this mAb inerfered with the first events of HIV-1 entry in iMDDCs. High concentrations of 2F5 triggered a non-HIV-related maturation of target cells. Blockade of FcγRII on iMDDCs decreased the anti-HIV acitvity of 2F5 while increased expression of FcγRI increased inhibition of HIV by 2F5, suggesting the involvment of these receptors in the HIV-inhibitory activity of this Ab. Holl *et al.* [2006b] (**neutralization**, **kinetics**, **dendritic cells**)
- 2F5: The ability of this Ab to inhibit viral growth was increased when macrophages and immature dendritic cells (iDCs) were used as target cells instead of PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs can occur by two distinct mechanisms, neutralization of infectivity involving only the Fab part of the IgG, and, an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**dendritic cells**)
- 2F5: 2F5 was shown to interact with cells transiently transfected by VSV-gp120 expressing vector and stained with sera from mice immunized intranasally with VSV vector expressing HIV-1 HXB2 gp120, indicating that VSV-HXB2 immunization produced anti-HIV-1 Abs. Jiang *et al.* [2006] (**vaccine antigen design**)
- 2F5: Pharmacokinetic properties of this Ab were studied in HIV infected patients infused with high doses of 2G12. The Ab did not elicit an endogenous immune response and had distribution and systemic clearance values similar to other Abs. The elimination half-life was measured to 4.3 days. Joos *et al.* [2006] (**kinetics**, **immunotherapy**)
- 2F5: 2 of 18 subtype C env-pseudotyped clones derived from individuals in acute/early stage of HIV-1 infection were neutralized by this Ab, both of them had a DKW motif reported to be a requirement for 2F5recognition. The sensitivity of clones to a mix of Abs IgG1b12, 2G12 and 2F5 was tracked to IgG1b12. Li *et al.* [2006c] (**neutralization**, **variant cross-recognition or cross-neutralization**, **acute/early infection**, **subtype comparisons**)
- 2F5: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. 2F5 was shown to bind specifically to CON6, CON-S and subtype B recombinant proteins but not to subtype A and C recombinant proteins or to the two subtype B gp120 proteins. The specific binding of 2F5 to CON-S indicated that its conformational epitope was intact. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- 2F5: PreTM peptide lacks the complete epitope sequence required for efficient recognition of this Ab. Thus, 2F5 was not able to arrest the leakage process and pore-formation at the viral membrane surface indicating that blocking of membrane destabilization depends on specific 4E10 epitope recognition. Lorizate *et al.* [2006a]
- 2F5: This Ab recognized AIS (amphipathic-at-interface sequence)-FP (fusion peptide) hybrid sequence with higher affinity than the linear AIS, indicating that the hybrid sequence better emulates the native gp41 2F5 epitope. Lorizate *et al.* [2006b] (**antibody binding site definition and exposure**, **binding affinity**)
- 2F5: gp41 and p15E of the porcine endogenous retrovirus (PERV) share structural and functional similarities, and epitopes in the membrane proximal region of p15E are able to elicit NAbs upon immunization with soluble p15E. Rabbits immunized with a VSV recombinant expressing an HIV-1 membrane-proximal external region (MPER) fused to PERV p15E, with a fusion p15E-HIV MPER protein boost, elicited HIV specific NAbs. The MPER contains the 2F5 epitope, and the 2F5 MAb was used as a positive control for neutralization in this study, and could bind to the vaccine construct. Luo *et al.* [2006] (**vaccine antigen design**)
- 2F5: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. 2F5 effectively neutralized wildype virus particles, however, it did not capture virus efficiently. 2F5 was found to bind to both nonfunctional monomers and to gp120-gp41 trimers. Binding of 2F5 to trimers correlated with its neutralization of wildtype virus particles. Monomer binding did not correlate with neutralization, but it did correlate with virus capture. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2F5: The effect of epitope position on 2F5 neutralization was examined by inserting the 2F5 epitope into MLV proline rich region Env surface protein (SU) or into MLV Env TM comparable to its natural position. 2F5 was shown to block cell fusion and virus infection with the SU-located 2F5 epitope while MLV with HA epitope at the same position was not neutralized by anti-HA. 2F5 was shown to block Env-mediated cell fusion in MLV with TM-located 2F5 epitope. Epitope position was also shown to have effect on neutralization by 2F5, where inhibition of cell fusion was more than 10-fold lower when the 2F5 epitope was in SU than in TM. Ou *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- 2F5: SHIV SF162p4 virus used as challenge in ISCOM vaccinated macaques was shown to be highly sensitive to neutralization by this Ab. Pahar *et al.* [2006] (**neutralization**)

B Cell

- 2F5: This Ab is shown to have the capacity to penetrate into the membrane interfaces and recognize isolated peptide-epitope sequence embeded into the membrane, however, 2F5 recognizes its epitope with lower affinity when immersed into the membrane interface. This lower affinity is suggested to result from a differently oriented epitope residues in the membrane-bound state. Sánchez-Martínez *et al.* [2006b] (**antibody binding site definition and exposure**)
- 2F5: The capacity of different soluble lysoderivatives to inhibit 2F5 binding to immobilized HIV-1 peptide epitope were compared and it was shown that only dilysocardiolipin resulted in effective blocking. Dilysocardiolipin was also shown to compete with native-functional gp41 for 2F5 recognition indicating that specific cardiolipin recognition by 2F5 involves the epitope-binding site. Sánchez-Martínez *et al.* [2006a] (**antibody binding site definition and exposure**)
- 2F5: Interaction of this Ab with membrane model systems revealed that 2F5 does not significantly interact with model viral or target cell membranes indicating that it does not use membrane interaction prior to gp41 docking. Veiga & Castanho [2006] (**antibody binding site definition and exposure**)
- 2F5:A fusion protein (FLSC R/T-IgG1) that targets CCR5 was expressed from a synthetic gene linking a single chain gp120-CD4 complex containing an R5 gp120 sequence with the hinge-Ch2-Ch3 portion of human IgG1. The fusion protein did not activate the co-receptor by binding. In PBMC assays, FLSC R/T-IgG1 neutralized primary R5 HIV-1 isolates more potently than 2F5, while in cell-line based assays they were comparable. Vu *et al.* [2006] (**neutralization**)
- 2F5: This Ab was used as a positive control in the neutralization assay. At the highest Ab concentrations, 2F5 was able to neutralize several primary isolates but not all, with a neutralization pattern similar to that of rabbit sera immunized with monovalent and polyvalent DNA-prime/protein-boost Env from different HIV-1 subtypes. At a reduced concentrations, 2F5 showed much weaker neutralizing activities. Wang *et al.* [2006a] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2F5: Viruses with wild-type HIV-1JR-FL Envs and HIV-1 hXBc2 Envs were neutralized by this Ab at much lower concentrations than HIV-1 YU2 Env viruses. Viruses bearing inserted artificial epitopes of FLAG in the V4 region were as sensitive to neutralization by this Ab as the parental viruses. A clear relationship between neutralization potency and the affinity of the anti-FLAG antibody for its cognate epitope was observed. Yang *et al.* [2006] (**neutralization**, **binding affinity**)
- 2F5: Significant levels of 2F5 were shown to bind to HA/gp41 expressed on cell surfaces and this Ab did stain cells expressing HA/gp41 in a fluorescence assay. However, a much smaller percentage of the HIV 89.6 Env expressing cells were stained with this Ab than with 2G12, indicating that this Ab recognition site on gp41 is masked by the gp120 subunit in the HIV Env protein and that it is more easily accessible on the HA/gp41 chimeric protein. Ye *et al.* [2006] (**antibody binding site definition and exposure**, **binding affinity**)
- 2F5: The epitope recognition sequence for this Ab was introduced into the corresponding region of SIVmac239 but the replication of this viral variant (SIVmac239/2F5) was delayed in comparison to the parental virus. SIVmac239/2F5 was specifically neutralized by MAb 2F5. Yuste *et al.* [2006] (**neutralization**, **SIV**)
- 2F5: Competition of free gp120 89.6 with immobilized gp140 89.6 for binding to 2F5 was assesed. The binding of this Ab to coated gp140 was not affected by an increase in the gp120 concentration. Zhang *et al.* [2006a] (**binding affinity**)
- 2F5: The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. Chimeric Env-pseudotyped virus Ch5, containing all three of the mutations, was only marginally more neutralization sensitive to 2F5 than Ch2, which did not contain any of these mutations. Env-pseudotyped viruses containing D457G mutation alone, or in combination with E440G or H564N, were also more sensitive to neutralization by 2F5 than Ch2. Beddows *et al.* [2005b] (**neutralization**)
- 2F5: Circular dichroism and NMR were used to analyze the structure of the HIV-1 inhibitor peptide T-20 (gp41 HXB2 aa 638-673) that contains the full 2F5 and partial 4E10 epitope. T-20 was unstructured towards the N terminus, and helical in the central and C-terminal regions. The 2F5 epitope sequence (gp41 HXB2 657-670) forms an intrinsic helical structure, which is stable in water. Biron *et al.* [2005] (**structure**)
- 2F5: A panel of 60 HIV-1 isolates, with complete genome sequences available, was formed for neutralization assay standardization. It comprises of 10 isolates from each of the subtypes A, B, C, D, CRF01_AE and CRF02AG, with majority of the viruses being of R5 phenotype and few of X4 phenotype. Neutralization profile of each isolate was assessed by measuring neutralization by sCD4, a cocktail of MAbs including 2G12, 2F5 and IgG1b12, and a large pool of sera collected from HIV-1 positive patients. The MAb cocktail neutralized with >50% a large portion of the isolates (51/60) including: 10 subtype A isolates, 8 subtype B isolates, 8 subtype C isolates, 9 subtype D isolates, 7 CRF-01_AE isolates, and 9 CRF_02AG isolates. Brown *et al.* [2005] (**neutralization**, **subtype comparisons**, **assay standardization/improvement**)
- 2F5: Four primary isolates (PIs), Bx08, Bx17, 11105C and Kon, were tested for binding and neutralization by 2F5. 2F5 was able to neutralize Bx08, Bx17 and 11105C with various efficiencies, but bound inefficiently to all four PIs. There was no direct correlation between binding and neutralization of the four PIs by 2F5. CD4-induced gp120 shedding had no effect on binding of 2F5 to Bx08. Burrer *et al.* [2005] (**neutralization**, **binding affinity**)
- 2F5: The structure of the 2F5 MAb, particularly its CDRH3 region's binding mechanisms to the MPER region of gp41, and possibly the cellular membrane as well, are reviewed. Engineering of Abs based on revealed structures of broadly neutralizing MAbs is discussed. Burton *et al.* [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 2F5: Guinea pigs were immunized with a hybrid HXB2/BaL Env (HIV HXB/BaL gp140δCFI, clade B) in which the tip of the V3 loop (GPGRA) was replaced with the 2F5 epitope LELDKWAS. 2F5 bound to the Env that carried the V3-replacement 2F5 epitope, but antibodies against this construct

B Cell

only neutralized the X4-tropic lab adapted HIV strain IIIB, and not CCR5-HIV BaL or SF162 isolates. Chakrabarti *et al.* [2005] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)

- 2F5: 2F5 was investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. 2F5 showed modest neutralization in the standard format, which was increased with the gp41 tail truncation and/or addition of a disulfide bridge linking gp120 and gp41. 2F5 was also able to neutralize in all the other neutralization formats analyzed, suggesting that it binds Env trimers at various stages of infection. None of the analyzed HIV-1 + human plasmas neutralized in the post-CD4/CCR5 format indicating absence of 2F5 and 4E10 - like Abs. Crooks *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **assay standardization/improvement**)
- 2F5: 2F5 recognizes the epitope ELDKWA, but does not neutralize viruses carrying the commonly found mutated epitope variants: ELDeWA, ELDsWA, ELDnWA, ELDqWA, ELDtWA, or ELnKWA. Peptide cocktails containing ELDKWA, ELnKWA, ELDeWk,and ELeKWA elicit polyclonal antibodies in rabbits that can bind to all of the natural variants that are escape variants for 2F5 expressed in gp41 via Western blotting, as well as ELDrWA. Dong *et al.* [2005a] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **escape**)
- 2F5: Trimeric gp140CF protein synthesized from an artificial group M consensus Env gene (CON6) bound well to 2F5, indicating correct exposure of the 2F5 epitope. Gao *et al.* [2005a] (**antibody binding site definition and exposure**)
- 2F5: 2F5 neutralized viral isolates HXBc2, SF162, 89.6, BaL, ADA, and YU2. Neutralization was concentration dependent, as higher MAb concentration resulted in higher % of neutralization. Grundner *et al.* [2005] (**neutralization**)
- 2F5:2F5 and 4E10 both bind to membrane proximal regions of gp41, and have long hydrophobic CDR3 regions characteristic of polyspecific autoreactive antibodies. Of 35 Env-specific MAbs tested, only 2F5 and 4E10 were reactive with phospholipid cardiolipin. Vaccine induction of antibodies that react with these gp41 membrane proximal regions may be rare because of elimination due to autoantigen mimicry. 2F5 also reacted with centromere B and histone autoantigens, and both 4E10 and 2F5 reacted with HEp-2 cells with diffuse cytoplasmic and nuclear patterns indicating polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 2F5: This review summarizes data on the polyspecific reactivities to host antigens by the broadly neutralizing MAbs IgG1b12, 2G12, 2F5 and 4E10. It also hypothesizes that some broadly reactive Abs might not be routinely made because they are derived from B cell populations that frequently make polyspecific Abs and are thus subjected to B cell negative selection. Haynes *et al.* [2005b] (**antibody generation**, **antibody interactions**, **review**)
- 2F5: Furin co-transfection did not have an effect on the reactivity of Δ140ct HXBc2 and 3.2P pseudoviruses with 2F5, or on their neutralization sensitivity. Presence or absence of sialic acid residues did not affect Env reactivity with 2F5. A cleavage-competent form of 3.2P reacted poorly with 2F5, while its cleavage-defective counterpart showed higher level of MAb reactivity. Both cleavage-competent and cleavage-defective HXBc2 showed higher levels of reactivity to 2F5. DDT-induced dissociation of SOS gp140 and the estimate of cleavage was scored higher when 2F5 was used as detection Ab than when B13 MAb was used. Herrera *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2F5: In an attempt to elicit 2F5-like antibodies, the 2F5 epitope ELDKWAS was constrained in the beta-turn sites of the immunoglobulin heavy chain, or alternatively was attached at the C-terminal ends of the immunoglobulin light chain. The constrained heavy chain inserted epitopes bound to 2F5 with 10-fold higher affinity than the light chain unconstrained versions, and when used as an immunogen, elicited epitope-specific antibodies in rabbits, but these antibodies could not neutralize the virus. Ho *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 2F5: Why broadly neutralizing Abs, such as 2G12, 2F5 and 4E10, are extremely rare, and their protective abilities and potential role in immunotherapy are discussed. Jülg & Goebel [2005] (**neutralization**, **immunotherapy**, **review**)
- 2F5: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding of certain MAbs and increased neutralization resistance to MAbs as well as to human polyclonal HIV-Ig and pooled human sera. 2F5 MAb, however, effectively neutralized both the LLP-2 mutant and wildtype viruses, and also exhibited similar levels of binding to both the LLP-2 mutant and the wildtype virus. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2F5: A series of genetically modified Env proteins were generated and expressed in both insect and animal cells to be monitored for their antigenic characteristics. For 2F5, most of the modified proteins expressed in insect cells containing the 3G mutation (mutations in 3 glycosylation sites) showed higher levels of binding to the MAb than the wildtype did. Additional presence of a glycosylation mutation 1G, close to the 2F5 epitope, increased binding of 2F5 compared to the binding to Env without the mutation. The highest binding to 2F5 was observed for the dV1V2 mutant. When expressed in animal cells, the 3G mutant was the one that displayed increased binding to 2F5 compared to other mutants. Kang *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 2F5: A trimeric recombinant gp140 construct was developed for immunization studies. Its structural integrity was assessed by a panel of MAbs. The trimeric recombinant gp140 lacked the membrane proximal ectodomain segment of gp41, but the 2F5 Ab did bind efficiently to the gp140 trimers containing the entire gp41 ectodomain. Kim *et al.* [2005] (**antibody binding site definition and exposure**)
- 2F5: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutral-

B Cell

ize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B V3s. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. Neutralization by Cameroonian sera MAbs was blocked by Clade A and B V3 loop fusion proteins, while NAbs to non-V3 epitopes, 2F5, 2G12, and b12, were not blocked. Krachmarov *et al.* [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 2F5: A trimeric gp41 construct comprising the env transmembrane domain and the extracellular C-terminal region (gp41ctm) was incorporated into liposomes. 2F5 bound to the liposome-incorporated gp41ctm, indicating that its extracellular region is accessible to this Ab. Sera from mice immunized with either gp41ctm alone or with gp41ctm-liposome did not show any significant neutralization activity, indicating that the construct might not properly expose its 2F5 epitope. Lenz *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**)
- 2F5: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. 13 out of 19 pseudoviruses were neutralized by 2F5, but few required higher concentration of the Ab for neutralization. MN, SF162.LS and IIIB strains were highly sensitive for neutralization by 2F5. Resistance to neutralization by 2F5 was associated with mutations in the DKW motif, or elsewhere in the 2F5 epitope. A mixture of IgG1b12, 2F5 and 2G12 (TriMab) exhibited potent neutralizing activity against all Env-pseudotyped viruses except one. 8 out of 12 Env-pseudotyped viruses were more sensitive to neutralization by 2F5 than their uncloned parental PBMC-grown viruses. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 2F5: A peptide containing eight copies of the ELDKWA-epitope separated by aa spacers GSGGGGS, RS, and GS was used to test the impact of spacers on eliciting antibody responses to peptides. Both GSGGGGS and GS induced high titers of ELDKWA peptide-specific Abs in BALB/c mice, which reacted with rsgp41. 2F5 served as a positive control in a Western Blot to determine whether epitope-specific Abs bound to recombinant protein rsgp41. Liu *et al.* [2005b] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 2F5: Pseudoviruses expressing HIV-1 envelope glycoproteins from BL01, BR07 and 89.6 strains were compared in neutralization assays to replication competent clone derived from transfection of 293T cells (IMC-293T) and to the IMC-293T derived from a single passage through PBMC (IMC-PBMC). The neutralization responses of pseudoviruses and corresponding IMC-293T to 2F5 were similar, while a significant decrease in viral neutralization sensitivity to 2F5 was observed for all three IMC-PBMC viruses. The decrease was associated with an increase in average virion envelope glycoprotein content on the PBMC-derved virus. Louder *et al.* [2005] (**neutralization**, **assay standardization/improvement**)
- 2F5: Nine anti-gp41 bivalent Fabs that interacted with either or both of the 6-helix bundle and the internal coiled-coil of N-helices of gp41 were selected from a non-immune human phage display library. The IC50 range for the inhibition of LAV ENV-mediated cell-fusion was 6-61 ug/ml. For context, 2F5 and 2G12 (IC50s of 0.5-1.5 ug/ml) were about an order of magnitude more potent in this assay than the best Fabs generated here. Louis *et al.* [2005] (**neutralization**)
- 2F5: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **antibody interactions**, **neutralization**, **vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **immunotherapy**, **review**)
- 2F5: Viruses containing substitutions at either L568 or K574 of the gp41 hydrophobic pocket were resistant to D5-IgG1 but were as sensitive to 2F5 as the wildtype virus. 2F5 neutralized more isolates than D5-IgG1 and was shown to be more potent. 2F5 did not, however, neutralize some of the isolates neutralized by D5-IgG1. Miller *et al.* [2005] (**neutralization**)
- 2F5: This short review summarizes recent findings of the role of neutralizing Abs in controlling HIV-1 infection. Certain neutralizing MAbs and their potential role in immunotherapy and vaccination, as well as the reasons for their poor immunogenicity, are discussed. Montefiori [2005] (**antibody binding site definition and exposure**, **therapeutic vaccine**, **escape**, **immunotherapy**)
- 2F5: A short review of studies on 2F5 interaction with autoantigens, epitope accessibility, structure, and neutralizing capability. The reasons why 2F5 appears infrequently in nature are discussed. Nabel [2005] (**antibody binding site definition and exposure**, **antibody generation**, **neutralization**, **immunotherapy**, **review**)
- 2F5: Passive immunization of 8 HIV-1 infected patients with 4E10, 2F5 and 2G12 (day 0, 4E10; days 7, 14 and 21 4E10+2G12+2F5; virus isolated on days 0 and 77) resulted in 0/8 patients with virus that escaped all three NAbs. No viruses fully escaped 2F5, although 5/8 developed a more than 2-fold increase in 2F5 IC50 concentrations at day 77. No changes in the 2F5 epitope were observed in the 77 day study period, although 3 patients had unusual 2F5 epitope sequences to start with (not A/ELDKWA but SLNNWN, ALDTWE, or KFD-NWA); all viruses were susceptible to 2F5 neutralization, although to varying degrees. In a companion in vitro study, resistance to a single MAb emerged in 3-22 weeks, but triple combination resistance was slower and characterized by decreased viral fitness. In the core of the 2F5 epitope, LDKW, the L and W were completely conserved in the in vitro study, but 9/13 cases had a D->N change, 1/13 a K->N, and 1/13 a K->Q. The lack of resistance to the combination of MAbs in vivo and the reduced fitness of the escape mutants selected in vitro suggests passive immunotherapy may be of value in HIV infection. Nakowitsch *et al.* [2005] (**escape**, **immunotherapy**)

B Cell

- 2F5: This study is about the V2 MAb C108g, that is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MABs 4117c, 2219, 2191, and 447-52D, but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 2F5: Escape mutations in HR1 of gp41 that confer resistance to Enfuvirtide reduced infection and fusion efficiency and also delayed fusion kinetics of HIV-1. The mutations also conferred increased neutralization sensitivity of virus to 2F5. Enhanced neutralization correlated with reduced fusion kinetics, indicating that the mutations result in Env proteins remaining in the CD4-triggered state for a longer period of time. Reeves *et al.* [2005] (**antibody binding site definition and exposure**, **drug resistance**, **neutralization**, **escape**, **HAART, ART**)
- 2F5: The antibody M2 is specific for a peptide flag inserted into the V4 loop of YU-2, a neutralization resistant variant with a short V4 loop. IgG1b12 and 2F5 could neutralize both the WT YU-2 and the modified variant. The high diversity of V4 suggests it does not play a direct role in receptor binding or viral entry, yet M2, specific for the peptide insert tag, can neutralize the modified virus, demonstrating that neutralizing activity doesn't have to block functionality of the virus. Ren *et al.* [2005] (**neutralization**)
- 2F5: More that 90% of viruses from both acutely and chronically infected HIV-1 patients were inhibited by this Ab, however, viruses from acute patients were significantly more sensitive to 2F5 than viruses from chronic patients. The epitope of this Ab was highly conserved among all isolates tested suggesting that the higher susceptibility of acute viruses may be due to better epitope accessibility. The sensitivity of viruses to 2F5 was also highly correlated to their sensitivities to 4E10. Rusert *et al.* [2005] (**antibody binding site definition and exposure**, **antibody interactions**, **autologous responses**, **neutralization**, **acute/early infection**)
- 2F5: Ab titers to the 2F5 binding peptide ELDKWA were tested by peptide ELISA in sera from Thais infected with CRF01 virus who were asymptomatic versus those who had AIDS, and antibody titers were found to be significantly lower in AIDS patients. The frequency of recognition of this peptide was low overall (15-35%) in CRF01 infections, as well as infections with clades A-G. Srisurapanon *et al.* [2005] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**, **rate of progression**)
- 2F5: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **binding affinity**, **immunotherapy**, **mother-to-infant transmission**, **review**, **structure**)
- 2F5: This review summarizes data on 447-52D and 2219 crystallographic structures when bound to V3 peptides and their corresponding neutralization capabilities. 2F5, like 447-52D and like other HIV-1 neutralizing Abs, was shown to have long CDR H3 loop, which is suggested to help Abs access recessed binding sites on the virus. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 2F5: Six acutely and eight chronically infected patients were passively immunized with a mix of 2G12, 2F5 and 4E10 neutralizing Abs during treatment interruption. Two chronically and four acutely infected individuals showed evidence of a delay in viral rebound during Ab treatment suggesting that NAbs can contain viremia in HIV-1 infected individuals. All subjects with virus sensitive to 2G12 developed Ab escape mutants resulting in loss of viremia and failure to treatment while no escape was observed for 4E10 and 2F5. Plasma levels of 2G12 were substantially higher than those of 2F5 and 4E10, and the 2G12 levels exceeded the in vitro required 90% inhibitory doses by two orders of magnitude in subjects that responded to Ab treatment. No such differences were observed for 2F5 or 4E10, suggesting that high levels of NAbs are required for inhibition in vivo, and that the in vivo concentrations of 4E10 and 2F5 might have been to low to control viremia and exert a selective pressure. Trkola *et al.* [2005] (**acute/early infection**, **escape**, **immunotherapy**, **HAART, ART**, **supervised treatment interruptions (STI)**)
- 2F5: This Ab recognized the gp41 epitope ALDKWQ from the 92/BR/025.9 strain. HIV-1 infected patients treated with T20 showed decreased reactivity of their sera to a peptide containing the 2F5 epitope. The Ab titer to this peptide recovered after cessation of T20 therapy. It is indicated that 2F5 may interfere with the T20-HR1 interaction. Vincent *et al.* [2005] (**antibody interactions**)
- 2F5: A multi-epitope ELDKWA/ELDEWA string in a glutathione S-transferase (GST) backbone elicited Abs in mice and rabbits that could bind to gp41 carrying either the 2F5 susceptible ELDKWA variant, or the ELDEWA escape variant. Vaccinations with only the ELDKWA epitope or the ELDEWA embedded-peptide constructs yielded type specific Abs. Wang *et al.* [2005c] (**vaccine antigen design**, **vaccine-specific epitope characteristics**, **escape**)
- 2F5: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- 2F5: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds had little effect on binding of the 2F5 to the glycoprotein, indicating that the inter-S-S bonds had no

B Cell

impact on the exposure of 2F5 epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)

- Two ELDKWA-specific MAbs were obtained from mice immunized with four copies of ELDKWA-epitope with spacers between the epitopes. The two Abs inhibited syncytium formation less efficiently then 2F5 but were as potent as 2F5 in neutralization of primary isolate 92US657. The two murine MAbs were ineffective against the laboratory-adapted HIV-1 IIIB strain while 2F5 neutralized successfully. Neither 2F5 nor the two new MAbs neutralized group O primary isolate BCF02. Zhang *et al.* [2005a] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**)
- 2F5: Alanine scanning mutations of the 21 amino acid region between positions 660-680 showed that only Ala substitutions in the DKW at the core of the epitope reduced binding, positions llelDKWanlwnwfdisnwlw. No single Ala mutation was resistant to both 2F4 and 4E10. Ala substitutions in 12 of the 20 positions enhanced neutralization sensitivity, LLeLdkwanLWNWFdIsnWLW.2F5 inhibits the neutralization activity of peptide T20. Zwick *et al.* [2005] (**antibody binding site definition and exposure**, **escape**)
- 2F5: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. 2F5 was cross-reactive with A, B, and E subtype viruses, some D, and no C clade viruses. DKW was defined as the core motif, and was found in only 25% of C clade sequences in the database. It was found in C clade viruses in a country specific manner – common in Burundi, Brazil and Ethiopia, rare in Botswana, India, and S. Africa. The potency of the neutralizing activity was somewhat context-dependent. DQW is a common D clade variant from Uganda, and all D viruses in this study were Ugandan. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2F5: Env sequences were derived from 4 men at primary infection and four years later; the antigenicity in terms of the ability to bind to 2G12, 2F5 and IgG1b12 was determined. 2G12 bound primarily to late clones in 3 of the 4 patients, and to both early and late in the other patient. Neither 2F5 nor IgG1b12 showed a difference in binding affinity to early or late envelopes. Dacheux *et al.* [2004] (**antibody binding site definition and exposure**, **acute/early infection**, **kinetics**)
- 2F5: Neonatal rhesus macaques were exposed orally to a pathogenic SHIV, 89.6P. 4/8 were given an intramuscular, passive immunization consisting of NAbs 2G12, 2F5 and 4E10, each given at a different body sites at 40 mg/kg per Ab, at one hour and again at 8 days after exposure to 89.6P. The four animals that were untreated all died with a mean survival time of 5.5 weeks, the four animals that got the NAb combination were protected from infection. This model suggests antibodies may be protective against mother-to-infant transmission of HIV. Ferrantelli *et al.* [2004b] (**mother-to-infant transmission**)
- 2F5: Nabs against HIV-1 M group isolates were tested for their ability to neutralize 6 randomly selected HIV-1 O group strains. IgG1b12 could neutralize some O group strains when used on its own, and quadruple combination of b12, 2F5, 2G12, and 4E10, could neutralize the six Group O viruses tested between 62-97%. The 2F5 epitope in the O group viruses was : ELDEWA. Ferrantelli *et al.* [2004a] (**variant cross-recognition or cross-neutralization**)
- 2F5: This paper reviews MAbs that bind to HIV-1 Env. 2F5 binds to a region of gp41 proximal to cluster II (aa 662-676), neighboring the binding site of the broadly neutralizing MAb 4E10 and of neutralizing Fab Z13. 2F5 is broadly neutralizing. Gorny & Zolla-Pazner [2004] (**review**)
- 2F5: A set of oligomeric envelope proteins were made from six primary isolates for potenial use as vaccine antigens: 92/UG/037 (clade A), HAN2/2 (clade B), 92/BR25/025 (clade C), 92/UG/021 (clade D), 93/BR/029 (clade F) and MVP5180 (clade O). This was one of a panel of MAbs used to explore folding and exposure of well characterized epitopes. The clade C isolate BR25 is apparently misfolded, as conformation-dependent antibodies did not bind to it. 2F5 bound to clade A, B, D and F HIV-1 primary isolates. Polyclonal sera raised in rabbits against these antigens cross-bound the other antigens, but none of the sera had neutralizing activity. Jeffs *et al.* [2004]
- 2F5: 2F5 was used as a positive control in a study that showed that A32-rgp120 complexes open up the CCR5 co-receptor binding site, but did not induce neutralizing antibodies with greater breadth among B subtype isolates than did uncomplexed rgp120 in vaccinated guinea pigs. Liao *et al.* [2004]
- 2F5: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. gp41 MAbs 246D, 98.6, 50-69, were decreased by trypsin, unaltered by thrombin, while NAb 2F5 binding was increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 2F5: Mice susceptible to MV infection were intraperitoneally immunized with native HIV-1 89.6 env gp160 and gp140 and δV3 HIV-1 89.6 mutants expressed in live attenuated Schwarz measles vector (MV). The gp160ΔV3 construct raised more cross-reactive NAbs to primary isolates. The constructs had an additional 2F5 MAb epitope, ELDKWAS, but responses were not directed towards this epitope. A HIVIG/2F5/2G12 combination was used as a positive control and could neutralize all isolates. Lorin *et al.* [2004] (**vaccine antigen design**)
- 2F5: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the glycan within the V3 loop (GM299 V3) and adjacent to the C-terminal end of the V3 loop (GM329 C3) did not alter neutralization susceptibility to 2F5, but the loss of glycans in C2 (GM292 C2), C4 (GM438 C4), or V5 (GM454 V5) increased 2F5 neutralization susceptibility. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater

B Cell

access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)

- 2F5: This review summarizes properties of 2F5 and its binding to the prefusogenic membrane proximal region of gp41. The linear core epitope does not stimulate cross-reactive NAbs when placed outside the context of gp41, suggesting its presentation in a highly specific moleuclar framework is critical. McGaughey *et al.* [2004] (**vaccine antigen design**, **review**)
- 2F5: 2F5 was used for screening of phage-displayed peptide libraries. 2F5 requires the DKW core for synthetic and phage-displayed peptide recognition, but is multispecific for amino acid residues flanking C-terminally the DKW core epitope. Three clones from the AADKW-X12 library had high affinity for 2F5, but did not share obvious holomogy with gp41 or each other; Ala substitution showed each bound to 2F5 with a different mechanism. Menendez *et al.* [2004] (**antibody binding site definition and exposure**, **mimotopes**)
- 2F5: A set of HIV-1 chimeras that altered V3 net charge and glycosylation patterns in V1V2 and V3, involving inserting V1V2 loops from a late stage primary isolate taken after the R5 to X4 switch, were studied with regard to phenotype, co-receptor usage, and MAb neutralization. The loops were cloned into a HXB2 envelope with a LAI viral backbone. It was observed that the addition of the late-stage isolate V1V2 region and the loss of V3-linked glycosylation site in the context of high positive charge gave an X4 phenotype. R5X4, R5, and X4 viruses were generated, and sCD4, 2G12 and b12 neutralization resistance patterns were modified by addition of the late stage V1V2, glycosylation changes, and charge in concert, while neutralization by 2F5 was unaffected. Nabatov *et al.* [2004] (**antibody binding site definition and exposure**, **co-receptor**)
- 2F5: An antigen panel representing different regions of gp41 was generated, and sera from 23 individuals were screened. Anti-gp41 titers were very high, and sera bound to many regions of gp41, there were no immunologically silent regions. Many individuals had broad responses to diverse regions. High titer responses tended to focus on the N-heptad, C-heptad and 2F5-4E10 regions, but there was no correlation between neutralization capacity of sera and the particular peptides recognized. 2F5 responded to the four antigens that carried the minimal EDLKWA epitope. 2F5 did not bind to the minimal epitope embedded in an alpha helix, supporting that the 2F5 conformation of EDLKWA is embedded in a beta sheet. 2F5 bound better to a synthetic peptide containing the proximal regions than to the native gp41. Opalka *et al.* [2004] (**assay standardization/improvement**)
- 2F5: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 2F5: A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CCcon19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. The IC50 for 2F5 was greater than 50 for CC1/85, and was 35 for CCcon19, so the passaged virus was weakly neutralized by 2F5. Pugach *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **viral fitness and reversion**)
- 2F5: The MAb 2F5 binds to the C-heptad and is neutralizing, but the MAb D50 binds to the C-heptad and is not neutralizing. 2F5 binds preferentially to native gp41 prior to receptor activation. D50 prefers the triggered form after receptor activation. Trapped fusion-intermediates suggest 2F5 remains present shortly after gp120 triggering by CD4, but may be lost by the time the six-helix bundle is formed. D50 binds equally to the fusion-intermediate and six-helix bundle. 2F5 neutralization seems to block a later step of the fusion process, but it does not inhibit binding of NC-1, a MAb specific for the six-helix bundle, so it does not prevent formation of the six-helix bundle. The results are most consistent with 2F5 inhibiting a post-fusion-intermediate step. de Rosny *et al.* [2004b] (**antibody binding site definition and exposure**, **antibody interactions**)
- 2F5: The mechanism of 2F5 neutralization was explored, and experiments suggest it is due to interference with a late step in viral entry. sCD4 binding to gp120 triggers conformational changes in gp41 allowing formation of the six helix bundle. The NAb 2F5 preferentially bound native gp41, prior to receptor triggering, while the antibody D50 that also binds to the heptad region, near 2F5, is not neutralizing, and preferentially bound the CD4-triggered gp41. The C and N peptides that can be used to block the formation of the six helix bundle and lock gp41 in the fusion intermediate state after sCD4 triggering enabled 2F5 to bind after sCD4, while D50 was able to bind to both the peptide-trapped and sCD4 induced six helix bundle equally well. The peptide-trapping studies suggest that 2F5 does not fix Env in the native conformation, but interferes with entry after the initial conformation changes occur. Nor does it block six-helix bundle formation, as 2F5 prebinding does not inhibit NC-1 binding, a MAb that binds specifically to the six-helix bundle. de Rosny *et al.* [2004a]
- 2F5: This review discusses research presented at the Ghent Workshop of prevention of breast milk transmission and immunoprophylaxis for HIV-1 in pediatrics (Seattle, Oct. 2002), and makes the case for developing passive or active immunoprophylaxis in neonates to prevent mother-to-infant transmission. Macaque studies have shown that passive transfer of NAb combinations (for example, IgG1b12, 2G12, 2F5, and 4E10; or 2G12 and 2F5) can confer partial or complete protection to infant macaques from subsequent oral SHIV challenge. Safrit *et al.* [2004] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2F5: A complex of the epitope peptide ELDKWAS bound to 2F5 was crystalized, and the peptide was found to interact with

amino acids near the base of the very long (22 residue) CDR 3H region of the Ab. Ala substitution of the CDR H3 region confirmed the importance of these sites near the base of the H3 loop for interaction with the epitope in the context of intact gp41 as well as the peptide. A Phe at the apex of the loop was not located directly in the binding site, however binding of 2F5 to the epitope was very sensitive to non-conservative substitutions in this position (F100G, F100H, and F100R); these diminished both binding affinity and 2F5 neutralization, suggesting a role for the very long CDR 3H region. The authors suggest that particularly long CDR H3 regions may be a common feature of HIV-1 NAbs, based on the 22 residues in H3 of 2F5, the 18 H3 residues in b12, and the 22 H3 residues in X5. They express concern that because small animals like mice are unable to elicit Ab responses with such long H3s, they may be poor model systems for HIV vaccine studies. Zwick *et al.* [2004] (**antibody binding site definition and exposure**, **antibody interactions**, **antibody sequence variable domain**, **structure**)

- 2F5: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. gp41 NAbs 2F5 and 4E10 are able to potently neutralize the SOS pseudovirion post-attachment, although 2F5 performed relatively poorly in the pre-attachment assay, a further support for previous studies that indicated it does not bind well to native Env, and may bind best after the virus is attached to cells. Binley *et al.* [2003] (**vaccine antigen design**)
- 2F5: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. Dey *et al.* [2003]
- 2F5: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. Ferrantelli *et al.* [2003] (**antibody interactions**, **immunoprophylaxis**, **mother-to-infant transmission**)
- 2F5: This study investigates the effects of glycosylation inhibitors on the binding between HIV-1 gp120 and mannose-binding lectin (MBL). Mannosidase I inhibitor deoxymannojirimycin (dMM) inhibits formation of complex and hybrid N-linked saccharides and yields virus with more mannose residues. dMM added during viral production significantly enhanced the binding 2F5 and 2G12, but not IgG1b12 in a viral capture assay. Hart *et al.* [2003] (**antibody binding site definition and exposure**)
- 2F5: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. Kitabwalla *et al.* [2003] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**, **subtype comparisons**)
- 2F5: This review dicusses the importance and function of protective antibody responses in animal model studies in the context of effective vaccine development. SHIV models have shown protection using high levels of MAbs can prevent infection, and partial protection that can influence disease course can be obtained from modest levels of NAbs. SHIV challenges studies conducted with infusions of combinations of MAbs b12, 2G12, and 2F5 are reviewed. Mascola [2003] (**immunoprophylaxis**, **review**)
- 2F5: Infusions of 2F5 and 2G12 intravenously administered 24h prior to vaginal SHIV-89.P challenge are able to protect macaques from infections. Animals that recieve a IL-2 adjuvanted DNA immunization SIV Gag and HIV Env have T-cell responses and lower viral loads, but were not protected. Suboptimal levels of 2F5 and 2G12 were not able to confer sterile protection in combination with the T-cell responses stimulated by DNA immunizations. Mascola *et al.* [2003] (**adjuvant comparison**, **vaccine-specific epitope characteristics**)
- 2F5: Cyclic peptides ELLELDKWASLW that adopt constrained beta-turn conformation of the 2F5 epitope beta-turn in the complexed crystal structure were synthesized and optimize 2F5 binding affinity. This peptide elicits high titer peptide-specific immune responses in guinea pigs that do not neutralize; the authors propose this may be the result of a short CDR3 loop in guinea pigs. McGaughey *et al.* [2003] (**antibody binding site definition and exposure**, **vaccine antigen design**, **binding affinity**, **structure**)
- 2F5: AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessation of therapy, which then declined to a low level. The polyclonal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. Montefiori *et al.* [2003] (**acute/early infection**, **escape**)
- 2F5: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. 2F5 recognized most variants from 3/4 individuals by gp41 WB; the 4th individual had the ELDKWA variant Aldkwa in all three isolates.

B Cell

The other single Env that was not recognized carried eldRwa. Ohagen *et al.* [2003] (**brain/CSF**, **escape**)

- 2F5: Most plasma samples of patients from early infection had NAb responses to early autologous viruses, and NAbs against heterologous strains tended to be delayed. Serial plasma samples were tested against serial isolates, and neutralization escape was shown to be rapid and continuous throughout infection. Autologous neutralization-susceptible and resistant viruses from four patients were tested for susceptability to neutralizing Ab responses using MAbs 2G12, IgG1b12 and 2F5. No correlation was established, all viruses tested were susceptible to at least one of the neutralizing MAbs. Two patients that did not have an autologous NAb response also did not evolve changes in susceptibility to these MAbs, while one patient with a pattern of autologous neutralization and escape acquired a 2G12 sensitive virus at month 6, and lost IgG1b12 sensitivity at month 21. Richman *et al.* [2003] (**autologous responses**, **acute/early infection**, **escape**)
- 2F5: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. Wang [2003] (**vaccine antigen design**, **review**)
- 2F5: The broadly neutralizing antibodies 2F5 and 2G12 were class-switched from IgG to IgA and IgM isotypes. Neutralizing potency was increased with valence for 2G12 so the IgM form was most potent, but for 2F5 the IgG form was most potent. Eight primary isolates were tested including two subtype A isolates. The polymeric IgM and IgA Abs, but not the corresponding IgGs, could interfere with HIV-1 entry across a mucosal epithelial layer, although they were limited in a standard neutralization assay. All isotypes could interact with activated human sera, presumably through complement, to inhibit HIV replication. Wolbank *et al.* [2003] (**complement**, **isotype switch**, **variant cross-recognition or cross-neutralization**, **mucosal immunity**, **subtype comparisons**)
- 2F5: A combination of MAbs 2F5 and 2G12 given in multiple infusions was found to be safe and well tolerated even in high doses in a phase I study of seven HIV-1 infected healthy volunteers—the median elimination half-life was 7.94 days for 2F5, and 16.48 for 2G12—no anti-2F5 or anti-2G12 IgM or IgG responses were detected—although there was some transient increases, overall plasma viral RNA levels decreased in 6/7 volunteers, by a median of 0.62 $\log_{10}$. Armbruster *et al.* [2002] (**immunotherapy**)
- 2F5: IgG1b12 neutralized many South African (5/8) and Malawian (4/8) clade C primary HIV-1 isolates, being more effective than 2F5 which neutralized only two Malawian and no South African isolates. 2G12 did not neutralize any of the 16 isolates. Bures *et al.* [2002] (**subtype comparisons**)
- 2F5: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate, with the exception of F240 which bound both equally well, which captured more virus than any other human MAb tested, and didn't neutralize either isolate. F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 and the gp41 MAb 2F5 for both R5X4 and R5 isolates. F240 also enhanced neutralization of the R5X4 isolate by 2F5, but had no effect on R5 virus. Anti-V3 MAb B4a1 did not impact 2F5 neutralization. Cavacini *et al.* [2002] (**antibody binding site definition and exposure**, **antibody interactions**, **co-receptor**)
- 2F5: A modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. Chakrabarti *et al.* [2002] (**vaccine antigen design**)
- 2F5: Six sera from HIV-exposed uninfected individuals(EU) had IgA neutralizing activity dominated by recognition of a distinctive epitope within gp41, QARILAV – sera of QAFILAV-immunized BALB/c mice was neutralizing with the dose-dependent behavior similar to 2F5. Clerici *et al.* [2002a] (**HIV exposed persistently seronegative (HEPS)**)
- 2F5: Review of NAbs that notes that 2F5 alone or in combination with other MAbs can protect some macaques against SHIV infection, that it is safe and well tolerated in humans, and that illustrates gp41's conformational change and exposure of the 2F5 epitope in the transient pre-hairpin form. Ferrantelli & Ruprecht [2002] (**immunoprophylaxis**, **review**)
- 2F5: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. 2F5 behaved very differently than these non-neutralizing antibodies: it bound to Env in the absence of target cells, and it was distributed evenly all over the cell surface, not localized in fusion domains. It did not interact with cells that exhibited cytoplasmic mixing. 2F5 was unusual in that it exhibited temperature dependence, and did not interact below 19 degrees C, in contrast to 2G12, M77 98-6 and IgG1b12 which bound strongly at temperatures ranging between 4-37 degrees. The authors suggest the temperature dependence of 2F5 may be due to encreased flexibility of the Envelope spike at warmer temperatures facilitating epitope exposure. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**, **kinetics**)
- 2F5: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other MAb against gp41 tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- 2F5: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-

B Cell

helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. Golding *et al.* [2002b]

- 2F5: UK1-br and MACS2-br are R5 isolates derived from brain tissue samples from AIDS patients with dementia and HIV-1 encephalitis; both are neurotropic, but only UK1-br induced neuronal apoptosis and high levels of syncytium formation in macrophages. UK1-br Env had a greater affinity for CCR5 than MACS-br, and required low levels of CCR5 and CD4 for cell-to-cell fusion and single round infection. PBMC infected with UK1-br and MACS2-br virus isolates were resistant to neutralization by MAb 2G12. UK1-br was more sensitive than MACS2-br to IgG1b12, 2F5 and CD4-IgG2 neutralization. This pattern of Ab reactivity was similar to the to CD4-independent varient ADA197N/K, and thought to result from conformational changes which better expose the CCR5 binding regions, although the loss of the particular N-linked glycosylation site in the V1V2 stem region of ADA was experimentally shown to not be responsible for the the CD4-independent phenotype of UK1-br. Gorry *et al.* [2002] (**brain/CSF**, **co-receptor**)
- 2F5: HIV-1 gp160ΔCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160ΔCT with a reconstituted membrane ten-fold better than the same protein on beads (except for the YU2 form that doesn't bind 2F5)—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160ΔCT PLs indistinguishably from gp160ΔCT expressed on the cell surface. Grundner *et al.* [2002] (**vaccine antigen design**)
- 2F5: ELDKWAS was embedded into a beta-turn-like conformational site on a framework of an antibody specific for human leukocyte antigen HLA-DR – this construct was recognized by 2F5, and is suggested as an adjuvant-independent vaccine candidate. Ho *et al.* [2002] (**vaccine antigen design**)
- 2F5: A mouse MAb was raised against a variant of ELDKWA core epitope of the NAb 2F5, eldEwa, derived from the 2F5 neutralization resistant variant MVP5180. 2F5 does not bind to the variants eldEwa, elNkwa (B.TH.TH936705) or elEkwa, while 14D9 binds only to eldEwa and not ELDKWA. The eldEwa variant is common in the HIV-1 O group. Huang *et al.* [2002] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2F5: DP178 is a peptide derived from the C-term heptad repeat of gp41 that is a potent inhibitor of viral-mediated fusion—it contains the 2F5 epitope but fails to stimulate 2F5-like NAbs upon immunization—the peptide was extended to force an increase in helicity, and the modified peptide had a increase in affinity for 2F5, but upon guinea pig immunization although high peptide-specific Ab titers were achieved the sera were incapable of viral neutralization—the authors propose that 2F5 may bind with low affinity to a maturation intermediate, which may account for its breadth and why it is hard to recreate the epitope, but also suggests that the high concentrations required for neutralization are not relevant *in vivo*. Joyce *et al.* [2002] (**antibody binding site definition and exposure**)
- 2F5: A 2F5 anti-idiotype murine MAb Ab2/3H6 was developed that blocks 2F5 binding to a synthetic epitope peptide and to gp160 in an ELISA competition assay – Ab2/3H6 diminished the neutralizing potency of 2F5 – Ab2/3H6 Fab fragments were capable of inducing neutralizing Abs and 2F5-epitope specific responses in immunized B6D2F1 mice. Kunert *et al.* [2002] (**vaccine antigen design**)
- 2F5: A polyepitope vaccine was designed based on three repeats of the 2F5 core epitope ELDKWA combined with the V3 region peptide GPGRAFY. Abs raised in mice could recognize the peptides, sgp41, and CHO-WT cells that expressed HIV-1 Env on their surface. Li *et al.* [2002] (**vaccine antigen design**)
- 2F5: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. Liu *et al.* [2002] (**immunoprophylaxis**, **vaccine antigen design**, **review**)
- 2F5: Rhesus macaques were better protected from vaginal challenge with SHIV89.6D (MAb 2G12, 2/4; MAbs 2F5/2G12, 2/5; and HIVIG/2F5/2G12, 4/5 infected) than from intravenous challenge (MAb 2G12, 0/3; MAbs 2F5/2G12, 1/3; and HIVIG/2F5/2G12, 3/6 infected)– the animals that were infected by vaginal challenge after Ab infusion had low or undetectable viral RNA levels and modest CD4 T-cell decline. Mascola [2002] (**immunoprophylaxis**)
- 2F5: ELDKWAS co-crystallized bound to the Fab' 2F5 fragment showed the epitope peptide in a type I beta-turn conformation. Pai *et al.* [2002] (**structure**)
- 2F5: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140 – SOS gp140-2F5-IgG1b12 formed multiple ring structures composed of two SOS gp140 proteins bridged by two Ab molecules, while 2F5 and 2G12 formed extended chains rather than closed rings. Schulke *et al.* [2002] (**vaccine antigen design**)
- 2F5: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – 2F5 recognized o-gp140. Srivastava *et al.* [2002] (**vaccine antigen design**)
- 2F5: The antiviral response to intravenously administered MAbs 2F5 and 2G12 was evaluated in 7 HAART-naive asymptomatic HIV-1 infected patients during a treatment period of 28 days. MAb therapy reduced plasma HIV RNA in 3/7 patients during the treatment period, and transiently reduced viral load in two more. CD4 counts were up in 3/7 through day 28, and transiently increased in three more. Vigorous complement activation was observed after 48/56 Ab infusions. Before treatment, 2F5 neutralized isolates from five patients and no escape was observed during treatment. Stiegler *et al.* [2002] (**complement**, **variant cross-**

recognition or cross-neutralization, **escape**, **immunotherapy**)

- 2F5: Expanding the minimal epitope ELDKWA to an end-capped, linear nonapeptide, Ac-LELDKWASL-amide attained maximal affinity within a set of native gp41-sequence peptides – scanning single residue substitutions confirmed that essential recognition requirements were the central DKW core sequence and the importance of the terminal Leu residues for high-affinity binding – high specificity binding pockets at central Lys and Trp side-chains and an absolute requirement for the carboxylate group of the Asp side chain were found – the nine residue fragment flanked by pairs of Ser and constrained by a disulfide bridge had high affinity for 2F5. Tian *et al.* [2002] (**antibody binding site definition and exposure**)
- 2F5: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b]
- 2F5: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. Xu *et al.* [2002] (**antibody interactions**, **immunoprophylaxis**, **subtype comparisons**)
- 2F5: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 2F5: ELNKWA is an escape variant not recognized by the broadly neutralizing MAb 2F5, which recognizes the core epitope ELDKWA – Abs were raised against the peptide escape variant CGELNKWAGELNKWA linked to KLH carrier – these polyclonal antibodies, like the monoclonal antibody TH-Ab1 also raised to ELNKWA, could recognize ELDKWA and escape mutant peptide epitopes ELEKWA and ELDEWA. Dong *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- 2F5: A combination of MAbs IgG1b12, 2F5, and 2G12 was given postnatally to four neonates macaques that were then challenged with highly pathogenic SHIV89.6P – one of the four infants remained uninfected after oral challenge, two infants had no or a delayed CD4(+) T-cell decline. Hofmann-Lehmann *et al.* [2001] (**immunoprophylaxis**)
- 2F5: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to antibody 2F5. Kolchinsky *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- 2F5: Review of studies in macaques that have shown immune control of pathogenic SHIV viremia, improved clinical outcome, and protection, and the implications of the observations for HIV vaccines. Mascola & Nabel [2001] (**review**)
- 2F5: Moore and colleagues review the data concerning the lack of a clear relationship between genetic subtype and serotype – 2F5 is considered in some detail, as it represents a rare vulnerability from the neutralizing antibody perspective, although while it is apparently linear, attempts to present the peptide to the immune system have failed to elicit neutralizing Abs. Moore *et al.* [2001] (**review**, **subtype comparisons**)
- 2F5: Matrix-assisted laser desorption ionization mass spectrometry (MALDI-MS) in combination with proteolytic protection was used to identify the functional epitope for MAb 2F5, NEQELLELDKWASLWN, in the disulfide bond associated gp120/gp41 protein SOS-gp140 (JRFL) – this minimal epitope is much larger than the ELDKWA core epitope previously defined by peptide ELISA, and this could help explain why ELDKWA-peptides are poor immunogens in terms of eliciting a 2F5-like antibody response. Parker *et al.* [2001] (**antibody binding site definition and exposure**)
- 2F5: A peptide called 5-Helix was designed that binds to the C-peptide region of gp41 – 5-Helix is a potent inhibitor of HIV-1 entry that binds immediately COOH-terminal to the C-peptide region targeted by 5-Helix – the conformation of the bound 2F5 epitope is a hairpin turn. Root *et al.* [2001]
- 2F5: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. Si *et al.* [2001]
- 2F5: A luciferase-reporter gene-expressing T-cell line was developed to facilitate neutralization and drug-sensitivity assays – luciferase and p24 antigen neutralization titer end points were found comparable using NAb from sera from HIV+ donors, and MAbs 2F5, 2G12 and IgG1b12. Spenlehauer *et al.* [2001] (**assay development**)
- 2F5: 4E10 binds proximal to 2F5 and neutralizes primary isolates of clades A, B, C, D, and E – viruses that were resistant to 2F5 were neutralized by 4E10 and vice versa. Stiegler *et al.* [2001] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 2F5: A phage peptide library was screened with MAb 2F5, and from the peptides that bound the amino acids DKW were found to be most critical for binding – the mimetic peptide RDWSFDRWSLSEFWL elicited a cross-reactive Ab response to gp41 when used to immunize rabbits. Tumanova *et al.* [2001]
- 2F5: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 2F5: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. Xu *et al.* [2001] (**antibody interactions**)
- 2F5: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- 2F5: Neutralizing synergy between MAbs 1b12, 2G12 and 2F5 was studied using surface plasmon resonance to determine the binding kinetics for these three mAbs with respect to monomeric and oligomeric env protein gp160 IIIB – the 2G12 epitope is highly accessible on both monomeric and oligomeric Envs, 1b12 is highly accessible on monomers but not oligomers, and 2F5 on neither form – binding of 2G12 exposes the 2F5 epitope on gp160 oligomers. Zeder-Lutz *et al.* [2001] (**antibody interactions**)
- 2F5: This paper primarily concerns 4E10 and Z13, MAbs that both bind proximally to the 2F5 binding site to a conserved epitope, and that neutralize some primary isolates from clades B, C, and E – the minimal 2F5 epitope is determined to be EQELLELDKWASLW, based on screening a gp160 fragment expression library, longer than previous studies – broadly neutralizing MAbs 2F5, IgG1b12, and 4E10 and Z13 fail to neutralize different subsets of viruses. Zwick *et al.* [2001b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2F5: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhancement with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2. Zwick *et al.* [2001c] (**antibody interactions**)
- 2F5: Paper uses IgG1 form of 2F5 – a triple combination of 2F5, F105 and 2G12 effectively neutralized perinatal infection of macaque infants when challenged with SHIV-vpu+ – the plasma half-life was 4.2 +/- 0.8 days. Baba *et al.* [2000] (**immunoprophylaxis**)
- 2F5: MAbs 98-6 and 2F5 both bind to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, and to C43 alone but not to N51 alone – 98-6 and 2F5 have comparable affinities for C43, but 98-6 has a higher affinity for the complex and 2F5 may bind to an epitope of C43 that is directly involved with complex formation –and IgG1 rec form of the Ab was used in this study. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 2F5: 2F5 is a candidate for immunotherapy, but generally IgG1 has a longer half life in humans than IgG3, so the isotype was switched – rec CHO-derived MAb 2F5 IgG1kappa and hybridoma-derived MAb 2F5 IgG3kappa displayed identical specificity, *in vitro* function, and epitope (ELDKWA) – it remains to be determined if isotype switching will prolongs beta-clearance. Kunert *et al.* [2000] (**immunotherapy**)
- 2F5: Low levels of anti-ELDKWA antibodies are observed in HIV-1 + individuals, so a C-domain P2 peptide linked to a carrier was used to immunize mice and rabbits, and stimulated a high-level anti-ELDKWA response. Liao *et al.* [2000] (**vaccine antigen design**)
- 2F5: ELDKWA peptide vaccine study. Lu *et al.* [2000c] (**vaccine antigen design**)
- 2F5: ELDKWA peptide vaccine study. Lu *et al.* [2000b] (**vaccine antigen design**)
- 2F5: Because HIV-1 is most often transmitted across mucosal surfaces, the ability of passive transfer of infused HIVIG/2F5/2G12 to protect against mucosal exposure of macaques to pathogenic SHIV 89.6PD was studied – HIVIG/2F5/2G12 protected 4/5 animals against vaginal challenge, 2F5/2G12 combined protected 2/5 animals, and 2G12 alone protected 2/4 animals – in contrast, Mascola and coworkers had previously shown single MAbs could not protect against intervenous challenge – Ab treated animals that got infected through vaginal innoculation had low viral loads and only modest declines in CD4 counts – the infused Abs were detected in the nasal, vaginal, and oral mucosa. Mascola *et al.* [2000] (**immunoprophylaxis**, **mucosal immunity**)
- 2F5: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs. Nyambi *et al.* [2000] (**subtype comparisons**)
- 2F5: A mini-review of observations of passive administration of IgG NAbs conferring protection against intervenous or vaginal SHIV challenge, that considers why IgG MAbs might protect against mucosal challenge. Robert-Guroff [2000] (**review**)
- 2F5: 2F5 or sCD4-IgG chimeric immunoadhesin were transferred into 3T3 cells, incorporated into a collagen structure called the neo-organ, and transplanted into SCIDhu mice that were then challenged with MN or LAI – the continuous production of the therapeutic molecules in this context resulted

B Cell

in dramatic reduction of viral load. Sanhadji *et al.* [2000] (**immunotherapy**)

- 2F5: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 timer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-) – 2F5 did not bind efficiently to these constructs, presumably because of the YU2 strain has a substitution in the 2F5 epitope (ALDKWA instead of ELDKWA). Yang *et al.* [2000] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)
- 2F5: rgp120 derived from a R5X4 subtype B virus was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs. Beddows *et al.* [1999]
- 2F5: Combinations of HIVIG, 2F5, 2G12 were administered in passive-transfer experiments 24 hours prior to challenge with pathogenic SHIV 89.6PD – 3/6 animals given HIVIG/2F5/2G12 were completely protected, the others had reduced viremia and normal CD4 counts – 1/3 monkeys given 2F5/2G12 showed transient infection, the other two had reduced viral load – all monkeys that received HIVIG, 2F5, or 2G12 alone became infected and developed high-level plasma viremia, although animals that got HIVIG or 2G12 had a less profound CD4 T cell decline. Mascola *et al.* [1999] (**immunoprophylaxis**)
- 2F5: A meeting summary presented results regarding neutralization –MAbs 2G12 and 2F5 tested for their ability to neutralize primary isolate infection of genetically engineered cell lines (cMAGI and others, presented by T. Matthews, A. Trkola, J. Bradac) – an advantage of such cells lines over PBMCs is that markers (X-Gal) can be added for staining to simplify the assay – the consensus of the meeting was that these engineered cell lines did not improve the sensitivity of detection of primary isolate neutralization – D. Burton and J. Mascola presented results concerning passive immunization and protection of hu-PBL-SCID mice and macaques, respectively, and both found combinations of MAbs that were able to achieve 99% neutralization *in vitro* corresponded to efficacy *in vivo*. Montefiori & Evans [1999] (**review**)
- 2F5: In a study of 116 HIV-1 + individuals, Ab reactivity to a peptide encompassing the ELDKWA peptide decreased in CDC stage C patients compared with stage A patients, and longitudinal studies showed a decline in 6/8 patients, while overall Ab reactivity to rec soluble gp160 stayed constant. Muhlbacher *et al.* [1999]
- 2F5: Review of the neutralizing Ab response to HIV-1. Parren *et al.* [1999] (**review**)
- 2F5: Hu-PBL-SCID mice were infected with HIV-1s JRCSF and SF162 to study the effect of NAbs on an established infection – no significant differences in the initial rate of decrease in viral load or the plateau levels of viral RNA between the b12 treated and control mice were seen – in most of the Ab treated mice b12 escape mutants were observed with varying patterns of mutations – a combination of b12, 2G12 and 2F5 protected 1/3 mice, and an isolate from one of the other two was resistant to neutralization by all three MAbs. Poignard *et al.* [1999] (**immunotherapy**)
- 2F5: Post-exposure prophylaxis was effective when MAb 694/98-D was delivered 15 min post-exposure to HIV-1 LAI in hu-PBL-SCID mice, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect delivered 4 hours post infection. Andrus *et al.* [1998] (**immunoprophylaxis**)
- 2F5: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. Connor *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- 2F5: The ELDKWA epitope was inserted into the antigenic site B of influenza hemagglutinin and expressed on baculovirus infected insect cells, flanked by 3 additional random amino acids, xELDKWAxx – FACS was used to isolate the clone that displayed the epitope with the most markedly increased binding capacity for 2F5, to identify particularly specific immunogenic constructs – PELDKWAPP was a high affinity form selected by FACS. Ernst *et al.* [1998] (**vaccine antigen design**)
- 2F5: Points out that 2G12 and 2F5, potent neutralizing antibodies, were identified by screening for cell surface (oligomeric Envelope) reactivity. Fouts *et al.* [1998]
- 2F5: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. Frankel *et al.* [1998] (**mucosal immunity**)
- 2F5: The natural immune response to the epitope of 2F5, ELDKWA, was studied in perinatally infected children and levels of reactivity to this epitope were correlated with absolute CD4 numbers over time and health status – 3/10 children who had no antibody reactivity to ELDKWA had substitutions in the epitope (ALDKWA, ELDQWA, and KLDKWA) – 2F5 competed with the ELDKWA-reactive sera depending on the serum titer. Geffin *et al.* [1998]
- 2F5: Used as a control in the study of anti-gp41 MAb NC-1 – 2F5 does not react with HIV-2 gp41 or gp160. Jiang *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- 2F5: The complete V, J and D(H) domain was sequenced – unlike non-neutralizing anti-gp41 MAb 3D6, five neutralizing MAbs (2F5, 2G12, 1B1, 1F7, and 3D5) showed extensive somatic mutations giving evidence of persistent antigenic pressure over long periods – in contrast to Geffin98, where multiple pediatric sera were found to compete with 2F5, cross-competition was noted to be very rare in sera from HIV+ adults – Kunert *et al.* propose that because there is a binding site of human complement factor H which overlaps the 2F5 binding site, it may generally be masked from the immune system – 2F5 also has a remarkably long CDR3 loop of 22 amino acids, and this region could not be readily assigned to any described D(H) fragment, leading to the suggestion of

B Cell

recombination of two fragments from novel regions. Kunert *et al.* [1998] (**antibody sequence variable domain**)

- 2F5: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS). Li *et al.* [1998] (**antibody interactions**)
- 2F5: This MAb and the results of Ugolini *et al.* [1997] are discussed – the authors propose that an Ab bound to gp41 would typically project less from the surface of the virion and so be unable to interfere with attachment Parren *et al.* [1998a]. Parren *et al.* [1998a]; Ugolini *et al.* [1997] (**review**)
- 2F5: MAbs 2G12, 2F5 and b12 are broadly neutralizing, as are some human polyconal sera, but this paper describes a set of primary isolates that are resistant to all three MAbs and 2 broadly neutralizing sera – results indicate that resistance levels of pediatric isolates might be higher than adult isolates – resistance in general did not seem to be conferred by a loss of binding affinity for gp120 or gp41, rather by a more global perturbation of oligomeric Envelope. Parren *et al.* [1998b] (**variant cross-recognition or cross-neutralization**)
- 2F5: Induces complement-mediated lysis in MN but not primary isolates – primary isolates are refractive to CML. Takefman *et al.* [1998] (**complement**)
- 2F5: A wide range of neutralizing titers was observed that was independent of co-receptor usage – 2F5 was the most potent of the MAbs tested. Trkola *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- 2F5: A neutralization assay was developed based on hemi-nested PCR amplification of the LTR (HNPCR) – LTR-HNPCR consistently revealed HIV DNA and was shown to be a rapid, specific and reliable neutralization assay based on tests with 6 MAbs and 5 isolates. Yang *et al.* [1998] (**assay development**)
- 2F5: This review summarizes results about 2F5: it binds extracellularly, near the transmembrane domain, it is the only gp41 MAb that is neutralizing, it reacts with many non-B clade viruses and has a paradoxically weak binding to virus, given the neutralizing titers. Burton & Montefiori [1997] (**review**)
- 2F5: In a multilab evaluation of monoclonal antibodies, only IgG1b12, 2G12, and 2F5 could neutralize at least half of the 9 primary test isolates at a concentration of < 25 mug per ml for 90% viral inhibition – the isolates with no 2F5 neutralizing susceptibility had the sequences ALGQWA or ELDTWA instead of EDLKWA – 7/9 primary isolates were neutralized, and ALDKWQ and ALDKWA were susceptible to neutralization. D'Souza *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB Env – strong neutralizer of SHIV-vpu+ – all Ab combinations tested showed synergistic neutralization – 2F5 has synergistic response with MAbs 694/98-D (anti-V3), 2G12, b12, and F105. Li *et al.* [1997] (**antibody interactions**)
- 2F5: Using concentrations of Abs achievable *in vivo*, the triple combination of 2F5, 2G12 and HIVIG was found to be synergistic to have the greatest breadth and magnitude of response against 15 clade B primary isolates. Mascola *et al.* [1997] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 2F5: A JRCSF variant that was selected for IgG1b12 resistance remained sensitive to MAbs 2G12 and 2F5, for combination therapy. Mo *et al.* [1997] (**antibody interactions**)
- 2F5: Review: MAbs 2F5, 2G12 and IgG1b12 have potential for use in combination with CD4-IgG2 as an immunotherapeutic or immunoprophylactic – homologous MAbs to these are rare in humans and vaccine strategies should consider including constructs that may enhance exposure of these MAbs' epitopes. Moore & Trkola [1997] (**review**)
- 2F5: Called IAM 2F5 – antibody mediated enhancement or inhibition seemed to be determined by isolate rather than antibody specificity – in this study, only 2F5 inhibited the entry of all the viruses studied, irrespective of their phenotype, and directly proportional to its affinity to monomeric HIV-1 gp160. Schutten *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: Of three neutralizing MAbs (257-D, IgG1b12, and 2F5), 2F5 was the only one to inhibit the entry of all viruses studied, both SI and NSI, with a potency proportional to its affinity for monomeric gp126. Schutten *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: Binding of anti-gp120 MAbs IgG1b12 or 654-30D does not mediate significant exposure of the gp41 epitopes for MAbs 2F5 and 50-69. Stamatatos *et al.* [1997] (**antibody interactions**)
- 2F5: Used to standardize polyclonal response to CD4 BS. Turbica *et al.* [1997]
- 2F5: The only MAb out of a large panel to show no correlation between viral binding inhibition and neutralization. Ugolini *et al.* [1997]
- 2F5: IgG1b12 was more potent with greater breadth than MAb 2F5 in an infection reduction assay including 35 primary isolates. Kessler II *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 2F5: Only 4/20 Argentinian and 3/43 Swedish HIV+ sera reacted with LLELDKWASL – sera reacting with peptides that contained ELDKWA tended to have high neutralization titers – the region carboxyl terminal to EDLKWA was found to be more important for polyclonal sera AB binding, 670-675 WNWFDI – 2F5 bound most strongly to the peptide QELLELDKWA. Calarota *et al.* [1996] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 2F5: 2F5 was infused into two chimpanzees which were then given an intravenous challenge with a primary HIV-1 isolate – both became infected, but with delayed detection and prolonged decrease in viral load relative to controls, indicating that preexisting, neutralizing antibodies (passively administered or actively elicited) affect the course of acute-phase virus replication and can be influential after the Ab can no longer be detected in the peripheral circulation. Conley *et al.* [1996] (**immunoprophylaxis**)
- 2F5: Neutralizes HXB2, primary isolates, and chimeric virus with gp120 from primary isolates in an HXB2 background. McKeating *et al.* [1996] (**variant cross-recognition or cross-neutralization**)

B Cell

- 2F5: A panel of immunotoxins were generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but killing was not directly proportional to binding. Pincus *et al.* [1996] (**immunotoxin**)
- 2F5: Review: one of three MAbs (IgG1b12, 2G12, and 2F5) generally accepted as having significant potency against primary isolates. Poignard *et al.* [1996b] (**review**)
- 2F5: Primary isolates from clade A, B, and E are neutralized by 2F5 – neutralization requires the LDKW motif – neutralization resistant isolates or 2F5 selected variants all had substitutions in the D or K. Purtscher *et al.* [1996] (**subtype comparisons**)
- 2F5: Review: only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. Sattentau [1996] (**review**)
- 2F5: ELDKWAS is in a gp41 binding region for the negative regulator of complement factor H (CFH) – Abs to HIV generally do not cause efficient complement-mediated lysis, but binding of 2F5 can interfere with CHF binding, facilitating HIV destruction by complement. Stoiber *et al.* [1996] (**complement**)
- 2F5: Found to neutralize MN, JRCSF, and two B subtype primary isolates, but not a D subtype primary isolate, by most labs in a multi-laboratory study involving 11 labs. D'Souza *et al.* [1995] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2F5: Broad cross-clade neutralization of primary isolates – additive neutralization in combination with anti-CD4BS MAb IgG1b12 (Called BM12). Kessler *et al.* [1995] (**subtype comparisons**)
- 2F5: Review: binds to the only generally accepted strong neutralizing epitope outside of gp120, one of only 3 MAbs with strong broad activity against primary viruses, the others are 2G12 and IgG1b12 – unique member of epitope cluster Moore & Ho [1995] and John Moore, per comm 1996. Moore & Ho [1995] (**review**)
- 2F5: MAb binding decreases the accessibility or alters the conformation of the gp41 fusion domain and of gp120 domains, including the binding site for the CD4 cell receptor. Neurath *et al.* [1995] (**antibody binding site definition and exposure**)
- 2F5: Called IAM 41-2F5 – exposed in the presence of gp120 on the cell surface, while most of gp41 is masked – binds proximal to transmembrane region. Sattentau *et al.* [1995] (**antibody binding site definition and exposure**)
- 2F5: Cross-clade primary virus neutralizing activity – LDKW defined as the core epitope. Trkola *et al.* [1995] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2F5: MAb generated by electrofusion of PBL from HIV-1 positive volunteers with CB-F7 cells. Buchacher *et al.* [1994] (**antibody generation**)
- 2F5: Called IAM-41-2F5 – neutralized lab and primary isolates – t 1/2 dissociation 122 min for the peptide, and 156 min for gp41 – core D(K/R)W – Ab resistant isolate had the sequence KLDNWA. Conley *et al.* [1994b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 2F5: Included in a multi-lab study for antibody characterization binding and neutralization assay comparison. D'Souza *et al.* [1994] (**assay development**)
- 2F5: Failed to show synergy with anti-CD4 binding site IIIB neutralizing antibodies. Laal *et al.* [1994] (**antibody interactions**)
- 2F5: 2F5 epitope ELDKWA inserted into an immunogenic loop in influenza virus hemagglutinin can elicit IIIB, MN and RF neutralizing sera in immunized mice. Muster *et al.* [1994] (**vaccine antigen design**)
- 2F5: Broadly reactive neutralizing activity, ELDKWA is relatively conserved – neutralized 2 primary isolates. Purtscher *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- 2F5: gp41 mutation (582 A/T) that reduces neutralization of anti-CD4 binding site MAbs does not alter 2F5's ability to neutralize. Thali *et al.* [1994]
- 2F5: Synergy with combinations of CD4-based molecules in inhibition of HIV-1 Env mediated cell fusion. Allaway *et al.* [1993] (**antibody interactions**)
- 2F5: Called IAM-41-2F5 – reports MAb to be IgG1 – the gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to conformationally sensitive neutralizing MAbs – neutralization efficiency of 2F5 is not affected. Klasse *et al.* [1993a] (**variant cross-recognition or cross-neutralization**)
- 2F5: DKWA defined as the core sequence – highly conserved epitope neutralizing MAb. Buchacher *et al.* [1992]; Muster *et al.* [1993] (**antibody binding site definition and exposure**)

- Z13e1: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. Three different assays were used to analyze gp41-directed neutralizing activity. MAb Z13e1 was shown to neutralize fourfold more potently in the post-CD4/CCR5 assay compared to the standard assay. Weak post-CD4/CCR5 neutralization was detected in five subtype B and two subtype C

B Cell

plasmas. Z13e1 was shown to neutralize two of the MPER-engrafted mutant viruses, but the subtype B plasmas did not exactly recapitulate this activity except in two cases, where the activity of the plasmas against a mutant suggested presence of Z13e1-like Abs. Neutralization of four subtype B plasmas was substantially inhibited by a Z13e1 peptide, suggesting presence of Z13e1-like Abs. Binley *et al.* [2008] (**neutralization**, **subtype comparisons**)

- Z13e1: The MPER region was shown to have an L-shaped structure, with the conserved C-terminal residues immersed in the membrane and the variable N-terminal residues exposed to the aqueous phase. The specific binding of Z13e1 to the MPER was comparable to that of 4E10, with little or no binding to the membrane alone. It is suggested that Z13e1, like 4E10, extracts its epitope from the viral membrane, and that the key requirement for neutralization is induction of structural rearrangement of the MPER hinge by the Ab. It is also suggested that exposure of the membrane-embedded residues of the MPER region to the immune system in their native L-shaped form may elicit neutralizing Abs. Sun *et al.* [2008] (**antibody binding site definition and exposure**)
- Z13e1: This review summarizes Z13e1 Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- Z13e1: Z13e1, a high affinity variant of Fab Z13, was identified through targeted mutagenesis and affinity selection against gp41 and an MPER peptide. Z13e1 showed 100-fold improvement in binding affinity for MPER antigens over Z13, and improved neutralization potency against sensitive HIV-1. Alanine scanning revealed that N671 and D674 residues are crucial for peptide recognition and neutralization of HIV-1 by this Fab. Z13e1 was shown to bind with high affinity to an epitope overlapping those of 2F5 and 4E10 with the minimal epitope WASLWNWFDITN, indicating that the limited neutralization potency results from the limited access to the epitope within the envelope trimer. Nelson *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- Z13e1: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. Z13e1 effectively neutralized wildype virus particles. Z13e1 was found to bind to both nonfunctional monomers, gp120-gp41 trimers and to gp41 stumps. Binding of Z13e1 to trimers correlated with its neutralization of wildtype virus particles. Although Z13e1 bound to monomers tightly, it was unable to capture wildtype virus particles efficiently. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)

- 4E10: Neutralization susceptibility of CRF01_AE Env-recombinant viruses, derived from blood samples of Thai HIV-1 infected patients in 2006, was tested to 4E10. Most CRF01_AE viruses showed high susceptibility to 4E10, including viruses with and without conserved 4E10 epitopes, suggesting that the susceptibility of CRF01_AE to 4E10 is not determined by the conservation of the core epitope sequence. Several X4R5 viruses were less susceptible to 4E10 compared with X4 or R5 viruses. There was no correlation observed between virus neutralization susceptibility to 4E10 and viral infectivity, the length of the gp120 variable regions, or the number of PNLG sites. Utachee *et al.* [2009] (**co-receptor**, **neutralization**, **subtype comparisons**)
- 4E10: 4E10 peptide SLWNWFNITNWLWYIK was used in MAbs 5A9 and 13H11 characterization. 4E10 showed strong binding to HIV-1 infected cells Alam *et al.* [2008] (**antibody interactions**)
- 4E10: Comparing specific signals of selection among gp41 sequences from different HIV-1 M subtypes and circulating recombinant forms revealed presence of 12 sites evolving under positive selection across multiple major HIV-1 lineages. Nine sites detected to be under positive selection in the external exposed domains of gp41 had a significant tendency to be located within neutralizing and other Ab epitopes. Comparison of two matched datasets of HIV-1 subtype C, sampled from patients with acute or chronic infections, showed 6 gp41 sites evolving under different selection pressures during acute and chronic infection. One of those sites was within the epitope of 4E10, which evolved under strong positive selection in the chronically infected patients, but under neutral or mildly negative selection in the acutely infected patients. Bandawe *et al.* [2008] (**immune evasion**, **acute/early infection**, **escape**)
- 4E10: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. Three different assays were used to analyze gp41-directed neutralizing activity. MAb 4E10 was shown to neutralize equivalently in the standard and post-CD4/CCR5 assay. Weak post-CD4/CCR5 neutralization was detected in five subtype B and two subtype C plasmas. 4E10 was shown to neutralize several of the MPER-engrafted mutant viruses, but the subtype B plasmas did not exactly recapitulate this activity except in one case, where the activity of the plasma against two mutants suggested presence of 4E10-like Abs. Neutralization of four subtype B plasmas was substantially inhibited by a 4E10 peptide, suggesting presence of 4E10-like Abs. Binley *et al.* [2008] (**neutralization**, **subtype comparisons**)
- 4E10: This study explored features of Env that would enhance exposure of conserved HIV-1 epitopes. The changes in neutralization susceptibility, mediated by two mutations, T569A (in the HR1) and I675V (in the MPER), were unparalleled in their magnitude and breadth on diverse HIV-1 Env proteins. The variant with both TA and IV mutations was >360-fold more susceptible to 2F5, 2.8-fold more susceptible to b12, >780-fold more susceptible to sCD4 and resulted in 18-fold enhanced susceptibility to autologous plasma and >35-fold enhanced susceptibility to the plasma pool. It was also >180-fold more susceptible to 4E10. Mutants with only one IV mutation was >24-fold more susceptible to 4E10. Blish *et al.* [2008] (**antibody binding site definition and exposure**, **enhancing activity**)
- 4E10: The goal of the study was to measure NAb responses in patients infected with HIV-1 prevalent subtypes in China. g160 genes from plasma samples were used to establish a pseudovirus-based neutralization assay. 4E10 neutralized all 27 Env-pseudotyped viruses. Chong *et al.* [2008] (**neutralization**, **subtype comparisons**)
- 4E10: NMR structure of P1, a minimal MPER region that permits interaction with the mucosal galactosyl ceramide HIV-receptor, was analyzed in interaction with 4E10 at different pH. The best fit between NMR P1 and crystal structures of the Ab was at pH 6 and 5. The binding of 4E10 to P1 inserted into the liposomes of different compositions mimicking various biological membranes revealed 5- to 10-fold higher affinity of 4E10 to P1 in the lipid environment compared to aqueous environment, suggesting that specific lipid environment stabilizes the appropriate structure of the HIV-1 peptide. Coutant *et al.* [2008] (**antibody binding site definition and exposure**, **kinetics**, **binding affinity**, **structure**)
- 4E10: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. There was no difference in 4E10 binding to wild type and mutant JR-FL, and 4E10 inhibited infection of the two pseudoviruses with comparable potencies. Dey *et al.* [2008] (**binding affinity**)
- 4E10: Variable domains of three heavy chain Abs, the VHH, were characterized. The Abs were isolated from llamas, who produce immunoglobulins devoid of light chains, immunized with HIV-1 CRF07_BC, to gp120. It was hypothesized that

B Cell

the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. 4E10 did not inhibit binding of the three neutralizing VHH Abs to gp120. Forsman *et al.* [2008] (**antibody interactions**)

- 4E10: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied. Preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations were used. The epitopes for 2F5 and 4E10 were found to be exposed only on a form designed to mimic an prehairpin intermediate state during viral entry, which helps to explain the rarity of 2F5- and 2E10-like antibody responses. Frey *et al.* [2008] (**antibody binding site definition and exposure**, **binding affinity**)
- 4E10: 3 viral quasispecies from an HIV-1 C-subtype infected child had different sensitivities to neutralization by 4E10, conferred by a rare mutation, F673L in the 4E10 epitope. Moderate changes in sensitivity were modulated by secondary positions in this epitope and motifs in the cytoplasmic tail. Gray *et al.* [2008] (**neutralization**, **escape**)
- 4E10: The IC50 for 4E10 in a standard neutralization assay is 6.3 nM but is increased 10-fold in the postattachment neutralization assay to 59 nM. The neutralization half-life for 4E10 is 15.9 minutes but is increased 4-fold to 57.9 minutes in the presence of N36Mut(e,g), peptide, which is a class 3 inhibitor that prolongates temporal window of neutralization by disrupting trimerization of the N-heptad repeat (N-HR) in the prehairpin intermediate by sequestering the N-HR into N-HR/N36Mut(e,g) heterodimers. HXB2 was neutralized synergistically by 4E10 and N36Mut(e,g), where the formation of N-HR/N36Mut(e,g) heterodimers enhances the probability of 4E10 binding and the binding of 4E10 enhances the probability of N-HR/N36Mut(e,g) heterodimer formation, greatly diminishing the probability of 6-helix bundle formation. HXB2 was also synergistically neutralized by 4E10 and sCD4. Gustchina *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **kinetics**)
- 4E10: This review summarizes the obstacles that stand in the way of making a successful preventive HIV-1 vaccine, such as masked or transiently expressed Ab epitopes, polyclonal B-cell class switching, and inefficient, late, and not sufficiently robust mucosal IgA and IgG responses. Possible reasons why HIV-1 envelope constructs expressing 4E10 epitope fail to induce broadly neutralizing Abs are discussed. Haynes & Shattock [2008] (**vaccine antigen design**, **review**)
- 4E10: A MPER peptide, AISpreTM, overlapping 2F5 and 4E10 epitope sequences, was capable of breaching the permeability barrier of lipid vesicles. 4E10 blocked the peptide bilayer-destabilizing activity, however, inclusion of sphingomyelin raft-lipids into the membrane bilayer reduced significantly the affinity of 4E10 for AISpreTM. In contrast, inclusion of cholesterol induced higher 4E10 affinity for the AISpreTM peptide. AISpreTM appears to insert less deeply into the lipid bilayer in the presence of cholesterole, which might increase 4E10 epitope accessibility for Ab binding. Thus, 4E10 epitope accessibility is affected by envelope lipid composition. Huarte *et al.* [2008a] (**antibody binding site definition and exposure**)
- 4E10: The study compared the in-membrane recognition and blocking activity of the 2F5 and 4E10 MAbs, using solution-diffusing, unstressed phospholipid vesicles with sizes that approximate to that of the HIV virion, and an MPER-derived sequences that combines the full length 2F5 and 4E10 epitopes. 2F5 MAb had lower affinity for membrane-bound species than 4E10 MAb, as defined by inhibition data together with direct electron microscopy and flow cytometry determination of the vesicle-antibody association. Huarte *et al.* [2008b] (**antibody binding site definition and exposure**)
- 4E10: A mathematical model was developed and used to derive transmitted or founder Env sequences from individuals with acute HIV-1 subtype B infection. All of the transmitted or early founder Envs were sensitive to neutralization by 4E10, but there was a modest heightened resistance of acute Envs compared to chronic Envs to neutralization by 4E10. Keele *et al.* [2008] (**neutralization**, **acute/early infection**)
- 4E10: pIg-tail expression system was used to construct a panel of cell-surface expression plasmids encoding the extracellular domain of gp41 with deletion of fusion peptide (FP), and/or introduction of L568P mutation. Deletion of FP resulted in significantly increased antigenicity of 4E10 epitope, indicating that FP and MPER may interact with each other, resulting in obstruction of the 4E10 epitope in MPER. L568P mutation resulted in significant enhancement of 4E10 binding to its epitope, suggesting that the mutation may destabilize the gp41 6-HB core conformation exposing the 4E10 epitope. Mice were immunized with DNA plasmids of FP-deleted and L568P mutant gp41, and with peptide containing the 4E10 epitope. Deletion of FP did not enhance the immunogenicity of the 4E10 epitope, however, the L568P mutation resulted in increased Ab response against 4E10 epitope compared to the response by peptide alone. Li *et al.* [2008b] (**antibody binding site definition and exposure**, **vaccine antigen design**, **binding affinity**)
- 4E10: CTB-MPR649-684 (cholera toxin subunit B and residues 649-684 of gp41 MPER region) peptide was developed for vaccine studies in rabbits. 4E10 affinity to the CTB-MPR peptide was equivalent to 4E10 affinity toward an MPR peptide, indicating that the fusion peptide presented antigenically competent MPR. Sera from immunized rabbits displayed no neutralizing activity, but could inhibit epithelial transcytosis of virus, indicating elicitation of non-neutralizing Abs capable of stopping mucosal transmission and infection of target cells. Matoba *et al.* [2008] (**binding affinity**)
- 4E10: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. In addition, 4E10 inhibited transmission of CCR5-tropic viruses while transmission of 4E10-neutralized X4 variants increased, indicating that X4 HIV-1 has an advantage over R5 in transmission when neutralized with 4E10. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)
- 4E10: 4E10 was shown to bind to Envs used in typical epitope binding assays, unlike the neutralizing Abs 8K8, DN9, and D5 used in this study. 4E10 neutralized all HIV-1 isolates tested, and its neutralization potency was 1 to 2 orders of mag-

B Cell

nitude higher than that one of mAbs 8K8 and D5. 4E10 displayed some cardiolipin binding activity. Nelson *et al.* [2008] (**autoantibody**, **neutralization**, **binding affinity**)

- 4E10: For assessment of gp41 immunogenic properties, five soluble GST-fusion proteins encompassing C-terminal 30, 64, 100, 142, or 172 (full-length) amino acids of gp41 ectodomain were generated from M group consensus env sequence. Although all five protein fragments contained the same epitope recognized by 4E10, GST-gp41-30 and -100 fragments were about 20- and 5-fold less reactive to 4E10, respectively, compared to the other three protein fragments which had similar reactivity. Patients considered as slow progressors generally exibited larger Ab reactivity against the 30aa fragment, indicating that these Abs target MPER region and exhibit 2F5- and 4E10-like properties. Plasma from these patients also exhibited broader and more potent neutralizing activity against several HIV-1 isolates. Plasma from 4 out of 44 patients reacted with peptides that bind 4E10, indicating that these patients mounted 4E10-like Ab response. Penn-Nicholson *et al.* [2008] (**rate of progression**)
- 4E10: The sensitivity of R5 envelopes derived from several patients and sevaral tissue sites, including brain tissue, lymph nodes, blood, and semen, was tested to a range of inhibitors and Abs targeting CD4, CCR5, and various sites on the HIV envelope. All but one envelope from brain tissue were macrophage-tropic while none of the envelopes from the lymph nodes were macrophage-tropic. Macrophage-tropic envelopes were also less frequent in blood and semen. There was no clear correlation between macrophage-tropism and neutralization sensitivity to 4E10, indicating that variation in macrophage tropism is not caused by variation in the membrane proximal region of Env. Peters *et al.* [2008b] (**neutralization**)
- 4E10: This minireview summarizes data on differences in neutralizing activities of MAbs and pooled human sera using a traditional primary cell neutralization assay and the more standardized TZM-bl reporter cell line assay. Also, suggestions are made on how to improve and standardize neutralization assays for comparable use in different laboratories. 4E10 neutralization was tested against a panel of 60 HIV-1 primary isolates (10 each from clades A-D, CRF01_AE and CRF02_AG) in the two assays. 17 viruses from the PBMC assay and 1 virus from the TZM-assay were not neutralized by this Ab. Only 52% of concordance between the two assays were shown for 4E10, and, as observed in other studies, 4E10 displayed much broader neutralization in the TZM-assay. It is suggested that the process of endocytosis in the TZM-assay alters exposure of the MPER region allowing 4E10 to neutralize more efficiently. In total, however, the assay discordances were shown to be bidirectional and not attributable to assay sensitivity. Polonis *et al.* [2008] (**neutralization**, **review**, **subtype comparisons**, **assay standardization/improvement**)
- 4E10: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to 4E10, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. The two escape mutant viruses were moderately more sensitive to the 4E10 neutralization than the parental isolates, which were resistant to neutralization by this Ab. There were no sequence-based explanations for the increased neutralization sensitivity of the escape viruses by 4E10. Overall, the study suggests that CCR5 inhibitor-resistant viruses are likely to be somewhat more sensitive to neutralization than their parental viruses. Pugach *et al.* [2008] (**co-receptor**, **neutralization**, **escape**)
- 4E10: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. 4E10 recognized both B and C trimers, indicating that the 4E10 epitope was exposed and preserved in the subtype C trimers. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)
- 4E10: MPER structure and interaction with 4E10 was studied by NMR, EPR and SPR techniques. The MPER region was shown to have an L-shaped structure, with the conserved C-terminal residues immersed in the membrane and the variable N-terminal residues exposed to the aqueous phase. 4E10 was shown to extract its epitope from the viral membrane in a multistep process: i) initial interaction of the Ab with N671 residue orients the peptide with the respect to Ab binding pocket, ii) the hydrophobic residues of the Ab induce rearrangement of multiple side chains of the peptide, with the F673 residue rotated into the Ab binding pocket, iii) insertion of F673 and W672 residues into the 4E10 binding pocket bends the N-terminal segment of the peptide in the opposite direction. The key requirement for neutralization is suggested to be induction of structural rearrangement of the MPER hinge by 4E10. It is also suggested that exposure of the membrane-embedded residues of the MPER region to the immune system in their native L-shaped form may elicit neutralizing Abs. Sun *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- 4E10: The neutralization profile of early R5, intermediate R5X4, and late X4 viruses from a rhesus macaque infected with SHIV-SF162P3N was assessed. 4E10 moderately neutralized the late X4 and the intermediate R5X4 viruses, but did not neutralize the parental R5. Tasca *et al.* [2008] (**co-receptor**, **neutralization**)
- 4E10: To investigate B-cell responses immediately following HIV-1 transmission, env-specific Ab responses to autologous and consensus Envs in plasma donors were determined. Broadly neutralizing Abs with specificity similar to 4E10 did not appear during the first 40 days after plasma virus detection. Tomaras *et al.* [2008] (**acute/early infection**)
- 4E10: 4E10 reacted with maltose-binding proteins MBP30 and MBP32, containing both HR1 and HR2 domains of gp41, and with MBP37 and MBP44, containing only the HR2 domain, but not with MBP-HR1, containing only the HR1 domain. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)
- 4E10: The various effects that neutralizing and non-neutralizing anti-envelope Abs have on HIV infection are re-

viewed, such as Ab-mediated complement activation and Fc-receptor mediated activities, that both can, through various mechanisms, increase and decrease the infectivity of the virus. The importance of these mechanisms in vaccine design is discussed. The unusual features of the 4E10 MAb are described. Willey & Aasa-Chapman [2008] (**review**)

- 4E10: Current insights into CTLs and NAbs, and their possible protective mechanisms against establishment of persistent HIV/SIV infection are discussed. Pre- and post-infection sterile and non-sterile protection of NAbs against viral challenge, and potential role of NAbs in antibody-mediated antigen presentation in modification of cellular immunity, are reviewed. Use of 4E10 in immunization experiments and its in vivo antiviral activity in suppression of viral rebound in HIV-1 infected humans undergoing structured treatment interruptions are described. Yamamoto & Matano [2008] (**immunotherapy**, **supervised treatment interruptions (STI)**, **review**)
- 4E10: The newly detected mAb m44 was shown to neutralize a panel of primary HIV-1 isolates with higher potency than 4E10, and the neutralization potency of the two mAbs was comparable for a subtype C SHIV strain. 4E10 did not compete with m44 for binding. A fusion protein of gp41 constructed for alanine-scanning mutagenesis bound to 4E10, indicating that its antigenic structure was intact. 4E10 bound to self antigens in lipid binding assays. Zhang *et al.* [2008] (**neutralization**, **binding affinity**)
- 4E10: The autoantibody nature of the two membrane proximal HIV-1 neutralizing antibodies, 2F5 and 4E10, was evaluated by comparison to human anti-cardiolipin mAbs derived from a primary antiphospholipid syndrome patient. Both 2F5 and 4E10 bound specifically to cardiolipin. CDR3 sequence similarities between 2F5, 4E10 and anti-cardiolipin mAbs were observed. A difference in the binding mode of both 2F5 and 4E10 when binding to peptide in solution versus peptide conjugated to lipids was observed, in that binding to the peptide-lipid conjugate was best fit by a two step conformational change model. These results suggest that these antibdies share binding and structural similarities with human autoantibodies and their induction by vaccines or natural infection therefore might be limited by immune tolerance mechanisms. Alam *et al.* [2007] (**kinetics**, **antibody sequence variable domain**)
- 4E10: 4E10 was shown to recognize liposomes containing phosphatidylinositol-4-phosphate (PIP) to the same extent that it recognized anionic liposomes lacking PIP. Binding of 4E10 to pure PIP was inhibited by Ca2+. Once bound to PIP, 4E10 could not be stripped off by addition of Ca2+, indicating an irreversible bond of 4E10 to PIP phospholipid fatty acids. Beck *et al.* [2007] (**antibody binding site definition and exposure**)
- 4E10: Sera from rabbits immunized with either monomeric gp120, trimeric cleavage-defective gp140 or disulfide-stabilized soluble trimeric gp140 were tested for neutralization of chimeric SIVmac239 viruses expressing epitope for this Ab. Little or no neutralization was observed indicating that little or no Ab activity in these rabbit sera was directed against the gp41 region. Beddows *et al.* [2007] (**neutralization**, **vaccine antigen design**)
- 4E10: Pseudoviruses derived from gp120 Env variants that evolved in multiple macaques infected with SHIV 89.6P displayed a range of degrees of virion-associated Env cleavage. Pseudoviruses with higher amount of cleaved Env were more resistant to neutralization by 4E10. The gp41 sequence was the same in all pseudoviruses, indicating that changes in gp120 can mediate sensitivity of gp41 to neutralization. Blay *et al.* [2007] (**neutralization**)
- 4E10: 7/15 and 9/15 subtype A HIV-1 envelopes from samples taken early in infection were neutralized by MAbs 4E10 and 2F5, respectively, and the potency was generally modest. Mutational patterns in the MAb binding sites did not readily explain the observed patterns of sensitivity and resistance. Blish *et al.* [2007] (**neutralization**, **variant cross-recognition or cross-neutralization**, **acute/early infection**, **subtype comparisons**)
- 4E10: This study confirmed binding of 4E10 to cardiolipin (CL) and showed that this Ab also binds to phosphatidylinositol phosphate (PIP). Binding of 4E10 to CL and PIP was inhibited by phosphocoline and enhanced by inositol (PIP only). Anti-PIP mouse monoclonal antibodies had neutralizing antibodies against 2 HIV primary isolates. Brown *et al.* [2007] (**mimics**, **neutralization**, **binding affinity**)
- 4E10: (R5)X4 viruses from early and late timepoints after X4 emergence were found to be more sensitive to neutralization by 4E10 than their coexisting R5 variants in one patient. Only early (R5)X4 viruses were more sensitive to neutralizaion by 4E10 in another patient. Bunnik *et al.* [2007] (**co-receptor**, **neutralization**)
- 4E10: Structural effects of both increasing peptide length and introducing helix-promoting constraints in the 4E10 epitope were investigated. Helical constraints increased binding affinity of the peptide epitope for 4E10 by increasing the stability of the complex and allowing interaction with an additional helical turn including Leu679 and Trp680. Crystal structures of the 4E10 bound to peptide epitopes revealed that the gp140 residues Trp672, Phe673, Ile675, Thr676 Leu679 and Trp680 have the most significant contact with the antibody, and the core motif was redefined as: WFX(I/L)(T/S)XX(L/I)W. Cardoso *et al.* [2007] (**antibody binding site definition and exposure**, **vaccine antigen design**, **structure**)
- 4E10: 2F5, 4E10, and m46 neutralization was more potent when tested in a HeLa cell line expressing low CCR5 than in a HeLa cell line expressing high CCR5 levels. PBMC tend to have low CCR5 expression. Choudhry *et al.* [2007] (**neutralization**, **assay standardization/improvement**)
- 4E10: SOSIP Env proteins are modified by the introduction of a disulfide bond between gp120 and gp41 (SOS), and an I559P (IP) substitution in gp41, and form trimers. The KNH1144 subtype A virus formed more stable trimers than did the prototype subtype B SOSIP Env, JRFL. The stability of gp140 trimers was increased for JR-FL and Ba-L SOSIP proteins by substituting the five amino acid residues in the N-terminal region of gp41 with corresponding residues from KNH1144 virus. b12, 2G12, 2F5, 4E10 and CD4-IgG2 all bound similarly to the WT and to the stabilized JRFL SOSIP timers, suggesting that the trimer-stabilizing substitutions do not impair the overall antigenic structure of gp140 trimers. Dey *et al.* [2007a] (**vaccine antigen design**)
- 4E10: Chimeric SIV viruses containing 2F5 and 4E10 epitopes were not neutralized by the broadly neutralizing sera

B Cell

from two clade B and one clade A infected asymptomatic individuals, indicating that MPER NAb epitopes did not account for the broad neutralizing activity observed. Dhillon *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**)

- 4E10: Kinetics experiments of 4E10 binding to MPER region during viral fusion showed that the 4E10 kinetics resembled those of the six-helix bundle formation and fusion blocker C34, indicating that the function of MPER in the fusion cascade is still in effect at a late stage in the fusion reaction. Binding of 4E10 was shown to decrease upon triggering HIV-1 Env-expressing cells with appropriate target cells and addition of C34 did not counteract this loss, suggesting that changes in exposure of MPER occur independently of the six-helix bundle formation. Dimitrov *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **kinetics**, **binding affinity**)
- 4E10: Newborn macaques were challenged orally with the highly pathogenic SHIV89.6P and then treated intravenously with a combination of IgG1b12, 2G12, 2F5 and 4E10 one and 12 hours post-virus exposure. All control animals became highly viremic and developed AIDS. In the group treated with mAbs 1 hour post-virus exposure, 3/4 animals were protected from persistent systemic infection and one was protected from disease. In the group treated with mAbs 12 hour post-virus exposure, one animal was protected from persistent systemic infection and disease was prevented or delayed in two animals. IgG1b12, 2G12, and 4E10 were also given 24 hours after exposure in a separate study; 4/4 treated animals become viremic, but with delayed and lower peak viremia relative to controls. 3/4 treated animals did not get AIDS during the follow up period, and 1 showed a delayed progression to AIDS , while the 4 untreated animals died of AIDS. Thus the success of passive immunization with NAbs depends on the time window between virus exposure and the start of immunoprophylaxis. Ferrantelli *et al.* [2007] (**immunoprophylaxis**)
- 4E10: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to 4E10 and other MAbs. Antibodies induced by immunization with these centralized proteins did not, however, have the breadth and potency compared to that of 4E10 and other broadly neutralizing MAbs. 4E10 physical characteristics of autoantibodies as a possible reason for lack of 4E10 broad production is also discussed. Gao *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **review**)
- 4E10: Addition of a glycosylation site at position V295N in two different subtype C envelope clones resulted in a twofold increase in neutralization sensitivity of the corresponding viruses to 4E10. Gray *et al.* [2007b] (**neutralization**)
- 4E10: The potency of 4E10 was 25-fold higher than the potency of new neutralizing Fab 3674 in neutralization of laboratory and primary strains of HIV-1 subtypes A, B and C. Gustchina *et al.* [2007] (**neutralization**, **subtype comparisons**)
- 4E10: This review summarizes current knowledge on the various functional properties of antibodies in HIV-1 infection, including 4E10 mAb, in vivo and in vitro activity of neutralizing Abs, the importance and downfalls of non-neutralizing Abs and antibodies that mediate antibody-dependent cellular cytotoxicity and the complement system, and summarizes data on areas tht need future investigation on Ab-mediated immune control. Huber & Trkola [2007] (**review**)
- 4E10: To test the immunogenicity of three molecularly engeneered gp41 variants on the cell surface their reactivity with 4E10 was assessed. The reactivity of 4cSSL24 variant was comparable to gp160 while the other two variants showed somewhat lower expression levels. When guinea pigs were immunized with the three variants, the level of the specific anti-gp41 Ab responses was low with the anti-gp41 response preferentially directed to the C-helical domain, away from the MPER region. Kim *et al.* [2007] (**vaccine antigen design**, **binding affinity**)
- 4E10: A new high throughput method was developed for neutralization analyses of HIV-1 env genes by adding cytomegalovirus (CMV) immediate enhancer/promoter to the 5' end of the HIV-1 rev/env gene PCR products. The PCR method eliminates cloning, transformation, and plasmid DNA preparation steps in the generation of HIV-1 pseudovirions and allows for sufficient amounts of pseudovirions to be obtained for a large number of neutralization assays. Pseudovirions generated with the PCR method showed similar sensitivity to 4E10 Ab, indicating that the neutralization properties are not altered by the new method. Kirchherr *et al.* [2007] (**assay development**, **neutralization**)
- 4E10: Four consensus B Env constructs: full length gp160, uncleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective uncleaved version mediated infection using the CCR5 co-receptor. Primary isolate Envs varied between completely resistant or somewhat sensitive to neutralization by membrane proximal Nabs 4E10 and 2F5. The most sensitive Con B construct was the truncated version of Con B Env with a stop codon immediately following the membrane spanning domain, suggesting that truncation of the gp41 cytoplasmic domain facilitates greater accessibility of the MPER region. The Con B gp160 was quite resistant, and the gp160-201N/S more sensitive, to 4E10 and 2F5. Kothe *et al.* [2007] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)
- 4E10: This review summarizes 4E10 Ab epitope, properties and neutralization activity. 4E10 use in passive immunization studies in primates and possible mechanisms explaining protection against infection are discussed. Also, 4E10 autoreactivity and its implications for active immunizations are discussed. Kramer *et al.* [2007] (**immunotherapy**, **review**)
- 4E10: V3 loop deletions were introduced into three different primary HIV-1 strains: R3A, DH12, and TYBE. The deletions included: ΔV3(12,12) containing the first and the last 12 residues of the V3 loop, ΔV3(9,9) containing first and last 9 residues, and ΔV3(6,6) ontaining first and last 6 residues. Only HIV-1 R3A ΔV3(9,9) was able to support cell fusion. Passaging of this virus resulted in a virus strain (TA1) that replicated with wildtype kinetics, and that acquired several adaptive changes in gp120 and gp41 while retaining the V3

B Cell

loop truncation. 4E10 exhibited modestly enhanced neutralization activity against TA1 and a ΔV1/V2 virus, while it failed to neutralize R3A. Laakso *et al.* [2007] (**neutralization**)

- 4E10: High levels of gp120-specific Abs were elicited when mice and rabbits were immunized by DNA priming and protein boosting with G1 and G2 grafts, consisting of 2F5 and 4E10, and 4E10 epitopes, respectivelly, engrafted into the V1/V2 region of gp120. A consistent NAb response against the homologous JR-FL virus was detected in rabbits but not in mice. 4E10 bound to the engrafted construct, but embedding the MPER epitopes in the immunogenic V1/V2 region did not result in eliciting anti-MPER antibodies in mice or rabbits. 4E10 binding to G2 was greater than to G1, and could be enhanced by deletion of one or two amino acid residues immediately preceding the 4E10 epitope, presumably due to rotation of the epitope along the alpha-helix in the engrafted region. Law *et al.* [2007] (**vaccine antigen design**)
- 4E10: 4E10 structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit anti-gp41 Abs, are reviewed in detail. The effect of the autoreactivity of 4E10 on vaccine antigen design is discussed. Lin & Nara [2007] (**vaccine antigen design**, **review**, **structure**)
- 4E10: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, a summary of the neutralizing activity of mAb 4E10 in different HIV-1 clades is provided. McKnight & Aasa-Chapman [2007] (**variant cross-recognition or cross-neutralization**)
- 4E10: Three MAbs, 2G12, 4E10 and 2F5, were administered to ten HIV-1 infected individuals treated with ART during acute and early infection, in order to prevent viral rebound after interruption of ART. MAb infusions were well tolerated with essentially no toxicity. Viral rebound was not prevented, but was significantly delayed in 8/10 patients. 2G12 activity was dominant among the MAbs used. Antiviral activity of 4E10 was not clearly demonstrated. Development of resistance to 4E10 was not observed despite ongoing viral replication. Plasma HIV-1 RNA levels did not increase following cessation of Ab infusion. Plasma viremia was essentially identical between patients not receiving MAb therapy and patients receiving 4E10 and 2F5 in the face of 2G12 resistance. 4E10 also failed to accumulate with repeated infusions in patient plasma. Long-term suppression of viremia was achieved in 3/10 patients. Mehandru *et al.* [2007] (**escape**, **immunotherapy**, **supervised treatment interruptions (STI)**)
- 4E10: 4E10-neutralized HIV-1 captured on Raji-DC-SIGN cells or immature monocyte-derived DCs (iMDDCs) was transfered to CD4+ T lymphocytes with 1.5 fold higher efficiency than non-neutralized virus. van Montfort *et al.* [2007] (**enhancing activity**, **neutralization**, **dendritic cells**)
- 4E10: Z13e1, a high affinity variant of Fab Z13, was identified through targeted mutagenesis and affinity selection against gp41 and an MPER peptide. Z13e1 showed 100-fold improvement in binding affinity for MPER antigens over Z13, but was still less potent than 4E10 at neutralizing several pseudotyped Envs. 4E10 was found to be less effective inhibitor of biotinylated Z13e1 than the other way around. Neutralization assays of HIV-1 JR2 MPER alanine mutants showed that mutants W666A and W672A were completely resistant to neutralization by 4E10. In contrast to a previous publication, it was also found that neutralization of HIV-1 JR-FL by 4E10 was not greatly improved in going from the Fab to IgG format. Nelson *et al.* [2007] (**antibody binding site definition and exposure**)
- 4E10: Four different co-receptor switch mutants were generated from ADA and BaL wildtype Envs (ADA-1, ADA-3, BaL-1B, and BaL2A) and the intermediate transition mutations were studied on either CCR5 or CXCR4 expressing cells for their sensitivity to 4E10 compared to wiltype. Most of the ADA-1 and ADA-3 mutants were more sensitive to 4E10 than the wildtype on both CCR5 and CXCR4 cells. BaL-1B mutants were highly sensitive to entry inhibition by 4E10 on CCR5 cells, which further increased on CXCR4 cells. BaL-2A mutants varied in their sensitivity to 4E10 inhibition, where only the final BaL-2A mutant, with all four mutations, was significantly more sensitive to 4E10 than the wildtype virus. Pastore *et al.* [2007] (**co-receptor**, **neutralization**)
- 4E10: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. 4E10 structure and binding to HIV-1 envelope and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, such as 4E10, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- 4E10: This study found that, contrary to expectations, the viruses resistant to b12, 4E10, 2G12 and 2F5 neutralization did not have lower replication kinetics than viruses sensitive to neutralization. Viruses from early infection tended to have relatively low replications rates. Quakkelaar *et al.* [2007a] (**neutralization**, **viral fitness and reversion**, **escape**)
- 4E10: The ability of 4E10 to neutralize recently transmitted viruses was examined in four homosexual and two parenteral transmission couples. The vast majority of recently transmitted viruses from homosexual recipients were moderately to completely resistant to neutralization by 4E10, although viruses isolated later in the course of infection showed increased sensitivity to 4E10 in one of the patients. In the parenteral transmission, one of the recipients had early viruses resistant to 4E10 neutralization, and one had viruses sensitive to 4E10 neutralization. The neutralization sensitivity patterns of recipient viruses to 4E10 did not correlate to the neutralization sensitivity patterns of their donors in the homosexual couples, while the HIV-1 variants from the parenteral pairs were similarly resistant/sensitive to neutralization by 4E10. Resistance to 4E10 did not correlate with sequence variation within the 4E10 epitope. Quakkelaar *et al.* [2007b] (**neutralization**, **acute/early infection**, **mother-to-infant transmission**)
- 4E10: A reference panel of recently transmitted Tier 2 HIV-1 subtype B envelope viruses was developed representing a broad spectrum of genetic diversity and neutralization sensitivity. The panel includes viruses derived from male-to-male, female-to-male, and male-to-female sexual transmissions, and

CCR5 as well as CXCR4 using viruses. The envelopes displayed varying degrees of neutralization sensitivity to 4E10, with 18 of 19 enevlopes sensitive to neutralization by this Ab. Schweighardt *et al.* [2007] (**neutralization**, **assay standardization/improvement**)

- 4E10: Infusion of a MAb cocktail (4E10, 2G12 and 2F5) into HIV-1 infected subjects was shown to be associated with increased levels of serum anti-cardiolipin and anti-phosphatidylserine Ab titers, and increased coagulation times. In the absence or in the presence of adult and neonate plasma, 4E10 exhibited dose-dependent reactivity with cardiolipin and phosphatidylserine, and low binding to β2GP1 and prothrombin. 4E10 induced prolongations of clotting times in human plasma, but those were mild and did not exceed grade I toxicities. Vcelar *et al.* [2007] (**antibody interactions**, **autoantibody**, **binding affinity**, **immunotherapy**)
- 4E10: Novel approaches based on sequential (SAP) and competitive (CAP) antigen panning methodiologies, and use of antigens with increased exposure of conserved epitopes, for enhanced identification of broadly cross-reactive neutralizing Abs are reviewed. Previously known broadly neutralizing human mAbs are compared to Abs identified by these methods. Zhang & Dimitrov [2007] (**review**)
- 4E10: This review summarizes current knowledge of HIV-1 lipid-protein interactions and antibodies to liposomal phospholipids and cholesterol. A potential use of Abs to lipids to neutralize HIV-1 and a potential role of the broadly neutralizing HIV-1 Abs, mainly 2F5 and 4E10, in binding to phospholipids is discussed. Alving *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**, **review**)
- 4E10: The optimal length of the 4E10 epitope was determined to the gp41 residues 671 to 683. Several residues in the epitope were shown to be essential for 4E10 recognition (W672, F673 and T676) and five more were shown to make significant contributions to 4E10 binding (N671, D674, I675, W680 and L679). When helix-promoting residues and helix-inducing tethers were incorporated, several peptides showed imroved affinity over the starting peptide suggesting that they may be more likely to elicit 4E10-like neutralizing Abs. Brunel *et al.* [2006] (**optimal epitope**, **kinetics**, **binding affinity**, **structure**)
- 4E10: The majority of broadly cross-reactive neutralizing (BCN) Envs were neutralized at lower concentrations of 4E10 than the non-BCN Envs. Amino acid variability of the 4E10 epitope was examined. The presence of T at position 662 was associated with increased sensitivity to neutralization by this Ab. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **escape**, **subtype comparisons**)
- 4E10: Neutralization of HIV-1 primary isolates of different HIV-1 clades (A, B, C, D, E) by 4E10 was determined in cells expressing high or low surface concentrations of CD4 and CCR5 receptors. CD4 cell surface concentration had no effect on the inhibitory activity of this Ab while the CCR5 surface concentration had a significant effect decreasing the 50% inhibitory concentration of 4E10 in cell lines with low CCR5. Choudhry *et al.* [2006] (**co-receptor**, **neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4E10: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). 4E10 was recognized less efficiently on the V2- and V3- deleted proteins than on SF162gp140. 4E10 was found to equally neutralize SF162 and Δ2F5.4E10, which is a virus with mutations in the 2F5 and 4E10 epitopes and is resistant to neutralization by 2F5 and 4E10. This indicates that 4E10-like Abs were not present in sera from the gp140-immunized animals nor in the SHIV-infected and in the HIVIG sera. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **antibody generation**, **neutralization**)
- 4E10: Genetic variability and co-variation of the mAb 2F5, 4E10 and Z13 epitopes in B and non B clades was investigated. A significant shift in the predominant sequence patterns over time was observed for all three epitopes. Also, significant inter-subtype genetic variability of the three epitopes was detected. However, the 4E10 epitope displayed a more similar variability within B clade and non-B clades, concurring with the cross-clade neutralizing activity of this mAb. Epitope co-variation was also noted, as one third of the recently isolated HIV-1 strains displayed simultaneous epitope variants. Dong & Chen [2006] (**antibody binding site definition and exposure**, **subtype comparisons**)
- 4E10: This MAb was used as a positive control in the neutralization assays. It neutralized two of three subtype B and 4 of 6 non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4E10: Env-pseudotyped viruses were constructed from the gp160 envelope genes from seven children infected with subtype C HIV-1. 4E10 alone or in combination with IgG1b12, 2G12 and 2F5 neutralized all of the seven viruses. Gray *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **responses in children**, **mother-to-infant transmission**)
- 4E10: The antigenic determinants recognized by 4E10 were characterized using recombinant glycosylated full-length Ags, and nonglycosylated and truncated Ags. This Ab recognized three peptides located at the N-terminal region of gp120 and gp41, respectively. It is suggested that 4E10 binds to the fusogenic peptide of gp41 and the N-terminal region of gp120, inhibiting insertion of fusogenic peptide into the host cell membrane. Hager-Braun *et al.* [2006] (**antibody binding site definition and exposure**, **optimal epitope**, **variant cross-recognition or cross-neutralization**, **binding affinity**)
- 4E10: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**antibody binding site definition and exposure**, **neutral-**

ization, **optimal epitope**, **escape**, **review**, **subtype comparisons**, **structure**)

- 4E10: Inhibition of R5 HIV replication by monoclonal and polyclonal IgGs and IgAs in iMDDCs was evaluated. The HIV-neutralizing activity of 4E10 was observed to be higher in iMDDCs than in PHA-stimulated PBMCs using both HIV-1 Bx08 and BaL. Holl *et al.* [2006b] (**neutralization**, **dendritic cells**)
- 4E10: The ability of this Ab to inhibit viral growth was increased when macrophages and immature dendritic cells (iDCs) were used as target cells instead of PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs can occur by two distinct mechanisms, neutralization of infectivity involving only the Fab part of the IgG, and, an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**dendritic cells**)
- 4E10: Pharmacokinetic properties of this Ab were studied in HIV infected patients infused with high doses of 4E10. The Ab did not elicit an endogenous immune response and had distribution and systemic clearance values similar to other Abs. The elimination half-life was measured to 5.5 days. Joos *et al.* [2006] (**kinetics**, **immunotherapy**)
- E10: All subtype C env-pseudotyped clones derived from individuals in acute/early stage of HIV-1 infection were neutralized by this Ab. One clone had a slightly different motif (WFNM) than the reported required WFXI in the epitope, yet it was highly susceptible to neutralization by 4E10, indicating additional flexibility in the 4E10 core epitope. Li *et al.* [2006c] (**neutralization**, **variant cross-recognition or cross-neutralization**, **acute/early infection**, **subtype comparisons**)
- 4E10: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. 4E10 was shown to bind specifically to CON6, CON-S and subtype B recombinant proteins but not to subtype A and C recombinant proteins or to the two subtype B gp120 proteins. The specific binding of 4E10 to CON-S indicated that its conformational epitope was intact. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- 4E10: This study showed that 4E10 Ab is able to specifically block the membrane-restructuring activity by recognizing preTM peptides inserted into the viral external membrane monolayer in the gp41 pre-fusion state. The recognition and blocking occurs in the presence of cholesterol and correlates with pore-formation blocking, suggesting interferance of the formation of fusion-competent complexes. Lorizate *et al.* [2006a] (**antibody binding site definition and exposure**)
- E10: Binding of this Ab to pre-TM sequence was shown not to be affected by presence of FP (fusion peptide) sequence. Lorizate *et al.* [2006b] (**antibody binding site definition and exposure**, **binding affinity**)
- 4E10: gp41 and p15E of the porcine endogenous retrovirus (PERV) share structural and functional similarities, and epitopes in the membrane proximal region of p15E are able to elicit NAbs upon immunization with soluble p15E. Rabbits immunized with a VSV recombinant expressing an HIV-1 membrane-proximal external region (MPER) fused to PERV p15E, with a fusion p15E-HIV MPER protein boost, elicited HIV specific NAbs. The MPER contains the 4E10 epitope. Luo *et al.* [2006] (**vaccine antigen design**)
- 4E10: SHIV SF162p4 virus used as challenge in ISCOM vaccinated macaques was shown to be highly sensitive to neutralization by this Ab. Pahar *et al.* [2006] (**neutralization**)
- 4E10: This Ab is shown to have the capacity to penetrate into the membrane interfaces and recognize isolated peptide-epitope sequence embeded into the membrane, where immersion into the lipid bilayer does not interfere with 4E10 recognition ability. The association of 4E10 with membranes is shown to be nonspecific. Sánchez-Martínez *et al.* [2006b] (**antibody binding site definition and exposure**)
- 4E10: Significant levels of 4E10 were shown to bind to HA/gp41 expressed on cell surfaces and this Ab did stain cells expressing HA/gp41 in a fluorescence assay. However, a much smaller percentage of the HIV 89.6 Env expressing cells were stained with this Ab than with 2G12, indicating that this Ab recognition site on gp41 is masked by the gp120 subunit in the HIV Env protein and that it is more easily accessible on the HA/gp41 chimeric protein. Ye *et al.* [2006] (**antibody binding site definition and exposure**, **binding affinity**)
- 4E10: The epitope recognition sequence for this Ab was introduced into the corresponding region of SIVmac239 and the replication of this viral variant (SIVmac239/4E10) was similar to the parental virus. SIVmac239/4E10 was specifically neutralized by MAb 4E10. SIVmac239/4E10 was neutralized by a LTNP plasma and somewhat with three other plasmas but addition of a 4E10 Ab inhibitor did not block the neutralization suggesting that 4E10 specificity represent only small fraction of neutralizing activity in plasma. Yuste *et al.* [2006] (**neutralization**, **SIV**)
- 4E10: Neutralizing activity of 4E10 against a panel of HIV-1 primary isolates from different clades was assessed in a PBMC-assay. The neutralizing activity was shown to be less potent than that of the newly characterized m48 MAb. Zhang *et al.* [2006a] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4E10: The structure of the 4E10 MAb, particularly its CDRH3 region's binding mechanisms to the MPER region of gp41, and possibly the cellular membrane as well, are reviewed. Engineering of Abs based on revealed structures of broadly neutralizing MAbs is discussed. Burton *et al.* [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 4E10: The crystal structure of 4E10 complexed with a 13 aa peptide (KGWNWFDITNWGK) that contains the NWFDIT binding site was resolved to 2.2 A resolution. 4E10 has a canonical beta sandwich Ig-fold, with H3/H2 loop hydrophobicity and a long CDR H3 loop that mediates C-terminal base and central amino acid interactions; it extends beyond the peptide and its orientation suggests it could potentially allow hydrophobic contacts with the viral membrane. 4E10 complex formation induces a conformational change in the peptide such that it forms an amphipathic alpha-helix with a hydrophobic face that interacts with 4E10, with Trp672 primary, and Phe673, Ile675 and Thr676 secondary, contact points. Cardoso *et al.* [2005] (**structure**)

B Cell

- 4E10: 4E10 was investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. Neutralization by 4E10 in the standard format was undetectable, which changed to modest with the gp41 tail truncation and/or addition of a disulfide bridge linking gp120 and gp41. 4E10 was also able to neutralize in post-CD4 and post-CD4/CCR5 formats, suggesting that it binds Env trimers at various stages of infection. None of the analyzed HIV-1 + human plasmas neutralized in the post-CD4/CCR5 format indicating absence of 2F5 and 4E10 - like Abs. Crooks *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **assay standardization/improvement**)
- 4E10: 2F5 and 4E10 both bind to membrane proximal regions of gp41, and have long hydrophobic CDR3 regions characteristic of polyspecific autoreactive antibodies. Of 35 Env-specific MAbs tested, only 2F5 and 4E10 were found to be reactive with phospholipid cardiolipin. Vaccine induction of antibodies that react with these gp41 membrane proximal regions may be rare because of elimination due to autoantigen mimicry. 4E10 also reacted with systemic lupus erythematosis (SLE) autoantigen SS-A/Ro, and both 4E10 and 2F5 reacted with HEp-2 cells with diffuse cytoplasmic and nuclear patterns indicating polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 4E10: This review summarizes data on the polyspecific reactivities to host antigens by the broadly neutralizing MAbs IgG1b12, 2G12, 2F5 and 4E10. It also hypothesizes that some broadly reactive Abs might not be routinely made because they are derived from B cell populations that frequently make polyspecific Abs and are thus subjected to B cell negative selection. Haynes *et al.* [2005b] (**antibody generation**, **antibody interactions**, **review**)
- 4E10: Why broadly neutralizing Abs, such as 2G12, 2F5 and 4E10, are extremely rare, and their protective abilities and potential role in immunotherapy are discussed. Jülg & Goebel [2005] (**neutralization**, **immunotherapy**, **review**)
- 4E10: A trimeric gp41 construct comprising the env transmembrane domain and the extracellular C-terminal region (gp41ctm) was incorporated into liposomes. 4E10 bound to the liposome-incorporated gp41ctm, indicating that its extracellular region is accessible to this Ab. Sera from mice immunized with either gp41ctm alone or with gp41ctm-liposome did not show any significant neutralization activity, indicating that the construct might not properly expose its 4E10 epitope. Lenz *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**)
- 4E10: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. All 19 pseudotyped viruses were highly sensitive to neutralization by 4E10 as were the MN, SF162.LS and IIIB strains. All 12 Env-pseudotyped viruses were more sensitive to neutralization by 4E10 than their uncloned parental PBMC-grown viruses. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 4E10: Pseudoviruses expressing HIV-1 envelope glycoproteins from BL01, BR07 and 89.6 strains were compared in neutralization assays to replication competent clone derived from transfection of 293T cells (IMC-293T) and to the IMC-293T derived from a single passage through PBMC (IMC-PBMC). The neutralization responses of pseudoviruses and corresponding IMC-293T to 4E10 were similar, while a significant decrease in viral neutralization sensitivity to 4E10 was observed for all three IMC-PBMC viruses. The decrease was associated with an increase in average virion envelope glycoprotein content on the PBMC-derived virus. Louder *et al.* [2005] (**neutralization**, **assay standardization/improvement**)
- 4E10: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **immunotherapy**)
- 4E10: This short review summarizes recent findings of the role of neutralizing Abs in controlling HIV-1 infection. Certain neutralizing MAbs and their potential role in immunotherapy and vaccination, as well as the reasons for their poor immunogenicity, are discussed. Montefiori [2005] (**antibody binding site definition and exposure**, **therapeutic vaccine**, **escape**, **immunotherapy**)
- 4E10: A short review of studies on 4E10 interaction with autoantigens, epitope accessibility, structure, and neutralizing capability. The reasons why 4E10 appears infrequently in nature are discussed. Nabel [2005] (**antibody binding site definition and exposure**, **antibody generation**, **neutralization**, **immunotherapy**, **review**)
- 4E10: Passive immunization of 8 HIV-1 infected patients with 4E10, 2F5 and 2G12 (day 0, 4E10; days 7, 14 and 21 4E10+2G12+2F5; virus isolated on days 0 and 77) resulted in 0/8 patients with virus that escaped all three NAbs. No viruses escaped 4E10, but only one virus in one patient had the NWFDIT epitope sequence; the W, F and I were conserved in all patients but the other amino acids varied both before and after treatment. A patient carrying the epitope sequence nwfSit had the least 4E10 sensitive virus. In a companion in vitro study, resistance to a single MAb emerged in 3-22 weeks, but triple combination resistance was slower and characterized by decreased viral fitness. In the core of the 4E10 epitope, NWFDIT, 5/11 cases had a T->I escape; 2/11 had a F->L change; and 2/11 had substantial deletions, of WNWF overlapping, or NWLWYI adjacent to the epitope. The lack of resistance to the combination of MAbs in vivo and the reduced fitness of the escape mutants selected in vitro suggests passive immunotherapy may be of value in HIV infection. Nakowitsch *et al.* [2005] (**escape**, **immunotherapy**)
- 4E10: Retrovirus inactivation for vaccine antigen delivery was

B Cell

explored through lipid modification by hydrophobic photoinduced alkylating probe 1.5 iodonaphthylazide (INA). The viral proteins were shown to be structurally intact in the treated non-infectious virus, through the preservation of antibody binding sites for polyclonal anti-gp120 serum, and for broadly neutralizing MAbs 2G12, b12 and 4E10, although the modifications of the lipid disabled viral infection. Raviv *et al.* [2005] (**vaccine antigen design**)

- 4E10: Escape mutations in HR1 of gp41 that confer resistance to Enfuvirtide reduced infection and fusion efficiency and also delayed fusion kinetics of HIV-1. The mutations also conferred increased neutralization sensitivity of virus to 4E10. Enhanced neutralization correlated with reduced fusion kinetics, indicating that the mutations result in Env proteins remaining in the CD4-triggered state for a longer period of time. Reeves *et al.* [2005] (**antibody binding site definition and exposure**, **drug resistance**, **neutralization**, **escape**, **HAART, ART**)
- 4E10: More that 90% of viruses from both acutely and chronically infected HIV-1 patients were inhibited by this Ab, however, viruses from acute patients were significantly more sensitive to 4E10 than viruses from chronic patients. The epitope of this Ab was highly conserved among all isolates tested suggesting that the higher susceptibility of acute viruses may be due to better epitope accessibility. The sensitivity of viruses to 4E10 was also highly correlated to their sensitivities to 2F5. Rusert *et al.* [2005] (**antibody binding site definition and exposure**, **antibody interactions**, **neutralization**, **acute/early infection**)
- 4E10: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **immunotherapy**, **review**, **structure**)
- 4E10: This review summarizes data on 447-52D and 2219 crystallographic structures when bound to V3 peptides and their corresponding neutralization capabilities. 4E10, like 447-52D and like other HIV-1 neutralizing Abs, was shown to have long CDR H3 loop, which is suggested to help Abs access recessed binding sites on the virus. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 4E10: Six acutely and eight chronically infected patients were passively immunized with a mix of 2G12, 2F5 and 4E10 neutralizing Abs during treatment interruption. Two chronically and four acutely infected individuals showed evidence of a delay in viral rebound during Ab treatment suggesting that NAbs can contain viremia in HIV-1 infected individuals. All subjects with virus sensitive to 2G12 developed Ab escape mutants resulting in loss of viremia and failure to treatment while no escape was observed for 4E10 and 2F5. Plasma levels of 2G12 were substantially higher than those of 2F5 and 4E10, and the 2G12 levels exceeded the in vitro required 90% inhibitory doses by two orders of magnitude in subjects that responded to Ab treatment. No such differences were observed for 2F5 or 4E10, suggesting that high levels of NAbs are required for inhibition in vivo, and that the in vivo concentrations of 4E10 and 2F5 might have been to low to control viremia and exert a selective pressure. Trkola *et al.* [2005] (**acute/early infection**, **escape**, **immunotherapy**, **HAART, ART**, **supervised treatment interruptions (STI)**)
- 4E10: Alanine scanning mutations of the 21 amino acid region between positions 660-680 showed only 3 substitutions that reduced 4E10 binding, positions lleldkwanlwnWFdisnwlW. No single Ala mutation was resistant to both 2F4 and 4E10. Ala substitutions in 11/20 positions enhanced neutralization sensitivity, LLeLdkWanLWNwfdIsNWLw. For peptides T20 and 4E10 neutralization was synergistic. Zwick *et al.* [2005] (**antibody binding site definition and exposure**, **escape**)
- 4E10: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. 4E10 was the most cross-reactive, moderately reactive in all 93 viruses tested from each subtype. WFXI was defined as the core motif, and this core is highly conserved in all M group gp41 sequences. How potent the neutralizing activity is is somewhat context dependent. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4E10; Neonatal rhesus macaques were exposed orally to a pathogenic SHIV, 89.6P. 4/8 were given an intramuscular, passive immunization consisting of NAbs 2G12, 2F5 and 4E10, each given at a different body sites at 40 mg/kg per Ab, at one hour and again at 8 days after exposure to 89.6P. The four animals that were untreated all died with a mean survival time of 5.5 weeks, the four animals that got the NAb combination were protected from infection. This model suggests antibodies may be protective against mother-to-infant transmission of HIV. Ferrantelli *et al.* [2004b] (**mother-to-infant transmission**)
- 4E10: Nabs against HIV-1 M group isolates were tested for their ability to neutralize 6 randomly selected HIV-1 O group strains. IgG1b12 could neutralize some O group strains when used on its own, and quadruple combination of b12, 2F5, 2G12, and 4E10, could neutralize the six Group O viruses tested between 62-97%. The linear epitope, NWFDIT, of 4E10 is conserved in 3/6 group O strains. Ferrantelli *et al.* [2004a] (**variant cross-recognition or cross-neutralization**)
- 4E10: This paper reviews MAbs that bind to HIV-1 Env. 4E10 binds to a region of gp41 proximal to cluster II (aa 662-676), neighboring the binding site of the broadly neutralizing MAb 2F5 and overlapping the epitope of neutralizing Fab Z13. 4E10 is the most broadly neutralizing MAb, neutralizing primary isolates from clades A, B, C, D, and CRF01 (E), although not the most potent. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4E10: An antigen panel representing different regions of gp41 was generated, and sera from 23 individuals were screened. Anti-gp41 titers were very high, and sera bound to many regions of gp41, there were no immunologically silent regions. Many individuals had broad responses to diverse regions. High titer responses tended to focus on the N-heptad,

B Cell

C-heptad and 2F5-4E10 regions, but there was no correlation between neutralization capacity of sera and the particular peptides recognized. 4E10 responded to the three antigens that carried the minimal NWFNIT epitope, but was conformation and context sensitive. Opalka *et al.* [2004] (**assay development**, **assay standardization/improvement**)

- 4E10: A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CCcon19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. The IC50 for 4E10 was greater than 50 for CCcon19, and was 44 for CC1/85, so the primary virus was weakly neutralized by 4E10. Pugach *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **viral fitness and reversion**)
- 4E10: This review discusses research presented at the Ghent Workshop of prevention of breast milk transmission and immunoprophylaxis for HIV-1 in pediatrics (Seattle, Oct. 2002), and makes the case for developing passive or active immunoprophylaxis in neonates to prevent mother-to-infant transmission. Macaque studies have shown that passive transfer of NAb combinations (for example, IgG1b12, 2G12, 2F5, and 4E10) can confer partial or complete protection to infant macaques from subsequent oral SHIV challenge. Safrit *et al.* [2004] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 4E10: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. gp41 NAbs 2F5 and 4E10 are able to potently neutralize the SOS pseudovirion post-attachment. Binley *et al.* [2003] (**vaccine antigen design**)
- 4E10: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. Ferrantelli *et al.* [2003] (**antibody interactions**, **immunoprophylaxis**, **mother-to-infant transmission**)
- 4E10: Porcine endogenous retroviruses (PERVS) are a concern in the context of porcine xenotransplantation into humans; possible strategies for protection include PERV knockout animals or vaccines. Goats immunized with the PERV transmembrane protein revealed two NAb epitope, E1 and E2. E2's epitope (FEGWFN) binds to a sequence that is perfectly preserved in all PERVS and highly conserved in all gammaretroviruses: MuLV carries FEGLFN, FeLV FEGWFN, and it shares three amino acids with the core epitope for the anti-HIV human neutralizing MAb 4E10, (LWNWFN). Fiebig *et al.* [2003]
- 4E10: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. Kitabwalla *et al.* [2003] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**, **subtype comparisons**)
- 4E10: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. Wang [2003] (**vaccine antigen design**, **review**)
- 4E10: Review of NAbs illustrating gp41's conformational change and exposure of the 4E10/Z13 epitope in the transient pre-hairpin form. Ferrantelli & Ruprecht [2002] (**antibody binding site definition and exposure**)
- 4E10: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ —the combination b12+2G12+2F5 conferred partial protection against SHIV89.6—such combinations may be useful for prophylaxis at birth and against milk born transmission—the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. Xu *et al.* [2002] (**antibody interactions**, **immunoprophylaxis**, **subtype comparisons**)
- 4E10: 4E10 binds proximal to 2F5 and neutralizes primary isolates of clades A, B, C, D, and E. Viruses that were resistant to 2F5 were neutralized by 4E10 and vice versa. Stiegler *et al.* [2001] (**antibody binding site definition and exposure**)
- 4E10: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. Xu *et al.* [2001] (**antibody interactions**, **subtype comparisons**)
- 4E10: MAbs 4E10 and Z13 both bind proximally to 2F5 to a conserved linear epitope that has some conformational aspects – both bind to MN virions, bind weakly to infected cells in a manner that is not disrupted by sCD4 and neutralize some primary isolates from clades B, C, and E – maps minimal 4E10 epitope to NWFDIT, contrary to an earlier report – different strains were refractive to neutralization by broadly neutralizing Abs IgG1b12, 2F5, Z13 and 4E10. Zwick *et al.* [2001b] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4E10: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhance-

ment with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2. Zwick *et al.* [2001c] (**antibody interactions**)

- 4E10: MAbs generated by hybridoma, electrofusion of PBL from HIV-1 + volunteers with CB-F7 heteromyeloma cells – also binds to MHC class II proteins – anti-class II Abs are only found in HIV-1 positive people – this paper maps 4E10's binding site to AEGTDRV, gp160(823-829), but the later Zwick *et al.* study in 2001 revised the epitope location. Buchacher *et al.* [1994] (**antibody binding site definition and exposure**, **antibody generation**)
- 4E10: Included in a multi-lab study for antibody characterization, binding and neutralization assay comparison. D'Souza *et al.* [1994] (**variant cross-recognition or cross-neutralization**)

Keywords antibody binding site definition and exposure, antibody generation, binding affinity, neutralization, review, SIV, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- Z13: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs, Z13 in particular, and sCD4 were able to shift JR-FL trimers. In contrast, most non-neutralizing Fabs bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**neutralization**, **binding affinity**)
- Z13: Similarity level of the Z13 binding site pentapeptide NWFDI to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 1 time, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- Z13: For assessment of gp41 immunogenic properties, five soluble GST-fusion proteins encompassing C-terminal 30, 64, 100, 142, or 172 (full-length) amino acids of gp41 ectodomain were generated from M group consensus env sequence. Plasma from 5 of 44 HIV-1 infected individuals reacted with a peptide that binds Z13, indicating that these patients mounted Z13-like Ab response. Penn-Nicholson *et al.* [2008]
- Z13: The newly detected mAb m44 was shown to neutralize a panel of primary HIV-1 isolates with higher potency than Fab Z13. In binding assays, Z13 did not bind to 5Hb region, but did bind the 6HB with the same potency as m44. Z13 did not compete with m44 for binding. A fusion protein of gp41 constructed for alanine-scanning mutagenesis bound to Z13, indicating that its antigenic structure was intact. Zhang *et al.* [2008] (**neutralization**)
- Z13: This review summarizes current knowledge on the various functional properties of antibodies in HIV-1 infection, including Z13 mAb, in vivo and in vitro activity of neutralizing Abs, the importance and downfalls of non-neutralizing Abs and antibodies that mediate antibody-dependent cellular cytotoxicity and the complement system, and summarizes data on areas tht need future investigation on Ab-mediated immune control. Huber & Trkola [2007] (**review**)
- Z13: This review summarizes Z13 Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- Z13: Z13 structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit anti-gp41 Abs, are reviewed in detail. Lin & Nara [2007] (**review**)
- Z13: Z13e1, a high affinity variant of Fab Z13, was identified through targeted mutagenesis and affinity selection against gp41 and an MPER peptide. Z13e1 showed 100-fold improvement in binding affinity for MPER antigens over Z13, and improved neutralization potency against sensitive HIV-1. Alanine scanning revealed that N671 and D674 residues are crucial for peptide recognition and neutralization of HIV-1 by this Fab. Z13e1 was shown to bind with high affinity to an epitope overlapping those of 2F5 and 4E10 with the minimal epitope WASLWNWFDITN, indicating that the limited neutralization potency results from the limited access to the epitope within the envelope trimer. Nelson *et al.* [2007] (**variant cross-recognition or cross-neutralization**)
- Z13: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. Z13 neutralization properties and binding to HIV-1 envelope, and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- Z13: Novel approaches based on sequential (SAP) and competitive (CAP) antigen panning methodologies, and use of antigens with increased exposure of conserved epitopes, for enhanced identification of broadly cross-reactive neutralizing Abs are reviewed. Previously known broadly neutralizing human mAbs are compared to Abs identified by these methods. Zhang & Dimitrov [2007] (**review**)

- Z13: This Ab was shown to infrequently neutralize cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors with and without broadly cross-reactive neutralizing antibodies. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- Z13: Genetic variability and co-variation of the mAb 2F5, 4E10 and Z13 epitopes in B and non B clades was investigated. A significant shift in the predominant sequence patterns over time was observed for all three epitopes. Also, significant inter-subtype genetic variability of the three epitopes was detected. However, the 4E10 epitope displayed a more similar variability within B clade and non-B clades, concurring with the cross-clade neutralizing activity of this mAb. Epitope co-variation was also noted, as one third of the recently isolated HIV-1 strains displayed simultaneous epitope variants. Dong & Chen [2006] (**antibody binding site definition and exposure**, **subtype comparisons**)
- Z13:gp41 and p15E of the porcine endogenous retrovirus (PERV) share structural and functional similarities, and epitopes in the membrane proximal region of p15E are able to elicit NAbs upon immunization with soluble p15E. Rabbits immunized with a VSV recombinant expressing an HIV-1 membrane-proximal external region (MPER) fused to PERV p15E, with a fusion p15E-HIV MPER protein boost, elicited HIV specific NAbs. The MPER contains the Z13 epitope. Luo *et al.* [2006] (**vaccine antigen design**)
- Z13: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. Z13 is able to recognize both gp120-gp41 trimers and monomers, as well as trimeric and monomeric gp41 stumps. Z13 failed to bind to VLPs before treatment with detergent but did after the treatment, suggesting that Z13 epitope becomes fully available only after the Env trimers are liberated by detergent. Moore *et al.* [2006] (**antibody binding site definition and exposure**)
- Z13: Epitope recognition sequences for Abs 2F5 and 4E10 were introduced into the corresponding region of SIVmac239. SIVmac239/4E10 and SIVmac239/2F5 were not neutralized by Z13 in spite of the overlap of Z13 and 4E10 sequences. Yuste *et al.* [2006] (**neutralization**, **SIV**)
- Z13: Competition of free gp120 89.6 with immobilized gp140 89.6 for binding to Z13 was assesed. The binding of this Ab to coated gp140 was decreased at the highest concentration of gp120. Neutralizing activity of Z13 against a panel of HIV-1 primary isolates from different clades was assessed in a PBMC-assay. The neutralizing activity was shown to be less potent than that of the newly characterized m48 MAb. Zhang *et al.* [2006a] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- Z13: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **review**)
- Z13: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- Z13: This paper reviews MAbs and Fabs that bind to HIV-1 Env. Z13 binds to a region of gp41 proximal to cluster II (aa 662-676), neighboring the binding site of the broadly neutralizing MAb 2F5 and overlapping the epitope of neutralizing MAb 4E10. Z13 is broadly neutralizing, neutralizing primary isolates from clades A, B, C, D and CRF01 (E). Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **review**)
- Z13: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. Wang [2003] (**vaccine antigen design**, **review**)
- Z13: Review of NAbs that notes Z13 is a phage display generated FAb fragment from a B clade infected individual and that illustrates gp41's conformational change and exposure of the 4E10/Z13 epitope in the transient pre-hairpin form. Ferrantelli & Ruprecht [2002] (**antibody binding site definition and exposure**, **antibody generation**)
- Z13: MAb 4E10 and FAb Z13 both bind proximally to 2F5 to a relatively conserved linear epitope that has some conformational aspects – both bind to MN virions, bind weakly to infected cells in a manner that is not disrupted by sCD4 and can neutralize some primary isolates from clades B, C, and E – Z13 was selected using a phage display library with the MN gp41 peptide LLELDKWASLWNWFDITNWSW from an HIV infected donor who had an exceptionally broad NAb response – different strains were refractive to neutralization by broadly neutralizing Abs IgG1b12, 2F5, Z13 and 4E10 – epitope location noted here is by analogy to MAb 4E10. Zwick *et al.* [2001b] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**)

- 41S-2: A murine Ab called i41SL1-2 was raised against the complementary determining region of the 41S-2 light chain, CRDL-1 (RSSKSLLYSNGNTYLY). As with 41S-2-L, the light chain of i41SL1-2 also had catalytic activity and degraded the immunizing peptide, initially cleaving between the Arg1 and Ser2. i41SL1-2 did not cross-react with gp41 peptide, gp120 V3 loop peptide and bound weakly to 41S-2-L.i41SL1-2 shows homology to the anti-VIP Ab (VIP, vasoactive intestinal peptide) that also has peptidase character. Both light chains contain a catalytic triad composed of Asp, Ser, and His (for i41SL1-2: Asp73, Ser 76 or Ser70 and His 79). Intact i41SL1-2 was unable to degrade CDRL-1, possibly due to an immobile inactive conformation of the catalytic triad. Hifumi *et al.* [2003] (**anti-idiotype**, **antibody sequence variable domain**)
- 41S-2: 41S-2-L refers to the light chain of 41S-2, which can enzymatically decompose the gp41 protein of HIV-1, but doesn't degrade unrealted proteins. The peptide RGPDRPEGIEEEGGERDRDRS, against which the MAb was raised, can also be cleaved, initially between Glu12-Gly13, followed by successive cleavage reactions. Hifumi *et al.* [2002]
- 41S-2: BALBc mice were immunized with gp41 peptide and a MAb specific for the peptide was generated – isolated MAb light chains displayed proteolytic activity toward the peptide epitope which may be due to a catalytic triad on light chain (Asp73, Ser76, and His79) – no catalytic activity was observed for the whole antibody. Hifumi *et al.* [2000a]
- 41S-2: The complementary determining region of 41S-2-L, the light chain of 41S-2, is strongly involved in gp41 recognition. This light chain can serve as a molecular catalyst for gp41 degredation. Hifumi *et al.* [2000b]

Keywords antibody binding site definition and exposure, review

- SAR1: This ERDRD-specific MAb recognizes an externalized loop of the gp41 C-terminal domain, and can reduce the yield of infectious progeny and inhibit fusion post-attachment, but not neutralize free virus. Dimmock [2005] (**review**)
- SAR1: This paper confirms the post-attachment neutralization (PAN) activity of this gp41 C-terminal tail-specific Ab – cell fusion between infected and uninfected cells is inhibited and is temperature dependent. This MAb does not neutralize free virus, and due to PAN activity, is considered to bind an epitope on the external surface of the membrane. The SAR1 epitope is exposed optimally after infected and non-infected cells have attached, prior to fusion. sCD4 binding does not enhance binding of SAR1. MAbs to adjacent epitopes do not have PAN activity. Heap *et al.* [2005a] (**antibody binding site definition and exposure**)

Keywords review

- ERDRD-specific IgG recognizes an externalized loop of the gp41 C-terminal domain, and these polyclonal antibodies are the only ones known to bind to this domain that can neutralize cell-free virus. This paper calls these antibodies EPES for Epitope Purified and ERDRD specific. Dimmock [2005] (**review**)
- The substitution 725 RG (P[R–>G]GPDRPEGIEEEGGERDRDRS) alters the antigenic exposure of this region on the virion resulting in the loss of the downstream neutralizing epitope ERDRD, increased exposure of the epitope GPDRPEG in the virion, while the epitope IEEE remains unchanged. McLain *et al.* [2001]

B Cell

- ERDRD-specific IgG recognizes an externalized loop of the gp41 C-terminal tail with high affinity – neutralized HIV-1 B clade strains IIIB, NL-4.3, RF, MN and D clade virus CBL-4, but HXB-2D (clade B) was not recognized – when PRGP-DRPEGIEEEGGERDRDRS was used as antigen an immunodominant, non-neutralizing response to IEEE was observed, but immunization GERDRDR shifts the response to ERDRD – NAb does not inhibit attachment of free virus, but does inhibit by an event that precedes fusion-entry. Cleveland *et al.* [2000b]

- 3019: This MAb was derived from plasma from a patient with env clade A virus with the GPGQ V3 motif. When cross-reactivity was tested, this Ab bound to both the V3subtypeB-fusion protein containing GPGR motif and V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize both clade B psSF162 (GPGR) and clade C psMW965 (GPGQ) virus and the majority of subtype B and non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 3019: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, a great reduction in sensitivity to neutralization was observed in the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, H, C, CRF02_AG and CRF01_AE). This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades except A1, indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006]

- AB-dependent, cell-mediated virus inhibition (ADCVI) following rgp120 vaccinations from the Vax 004 trial was examined. It was found that the level of ADCVI activity correlated inversely with the rate of HIV infection following vaccination. For every 10% increase in ADCVI activity there was a 6.3% decrease in infection rate. The degree to which the ADCVI Ab response predicted the rate of infection was shown to be influenced by polymorphisms at the FcγRIIa and RIIIa gene loci. Forthal *et al.* [2007] (**ADCC**)

- Fab 1018: Bivalent Fab 1018 (bF-1018) does not neutralize HXB2 on its own, but it reduces the neutralization IC50 of N36Mut(e,g) peptide, which is a class 3 inhibitor that disrupts trimerization of the N-heptad repeat (N-HR) in the prehairpin intermediate by sequestering the N-HR into N-HR/N36Mut(e,g) heterodimers. bF-1018 also fails to neutralize SF162, but in the presence of N36Mut(e,g) neutralization activity is observed. Gustchina *et al.* [2008] (**neutralization**, **kinetics**)
- 1018: This is one of nine anti-gp41 bivalent Fabs selected from a non-immune human phage display library. This Fab was classified as class B, and inhibits LAV mediated Env-mediated cell fusion with an IC50 of 7 +/- 1 ug/ml (the range for the 9 new Fabs was 6-61 ug/ml – for context, 2F5 and 2G12 (IC50s of 0.5-1.5 ug/ml) were about an order of magnitude more potent in this assay than the best Fabs generated here). 1010 and 1018, both class B, were the most potent Fabs. Keywords antibody binding site definition and exposure

- 126-7: 126-7 reacted with maltose-binding proteins MBP30 and MBP32, containing both HR1 and HR2 domains of gp41, but did not react with MBP37 and MBP44, containing only the HR2 domain, nor with MBP-HR1, containing only the HR1 domain. In ELISA, 126-7 reacted with the complex formed between MBP-HR1 and H44 (His-targeted protein) and C34, but failed to recognize the mixture of MBP-HR1 and T20, MBP3 and C34, and MBP3 and H44. In addition, 126-7 recognized the peptide complex N36/C34 but not the peptides individually. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)

- 13H11: This MAb partially blocked 2F5 MAb binding to Env but did not neutralize primary isolates or bind host lipids. MAb 13H11 and the 3 cluster II human MAbs 98-6, 126-6 and 167-D blocked 2F5 binding to gp41 epitopes to variable degrees; the combination of 98-6 and 13H11 completely blocked 2F5 binding.Two murine MPER MAbs 13H11 and 5A9 completely blocked each other's binding. While length of peptide had no effect on 2F5 binding, dissociation rate constants For 5A9 and 13H11 were several fold greater when bound to shorter (15-mer) peptide EQELLELDKWASLWN compared to 20-mer and 35-mer peptides, indicating conformational nature of 5A9 and 13H11 epitopes. Alam *et al.* [2008] (**antibody generation**, **antibody interactions**, **kinetics**, **binding affinity**)
- 13H11: This was a non-neutralizing anti-gp41 membrane proximal antibody raised in mice immunized with an M group consensus (Con-S) HIV-1 gp140 oligomer that expressed the 2F5 epitope. Like 2F5, 13H11 bound to the gp140 heptad repeat-2 peptide (DP178) and could cross-block binding of 2F5 to DP178. Unlike 2F5, 13H11 could not bind to phospholipids, including cardiolipin, and cannot neutralize primary isolates. Alam *et al.* [2007] (**antibody binding site definition and exposure**, **antibody generation**, **antibody interactions**)
- 13H11: This review summarizes data on the polyspecific reactivities to host antigens by the broadly neutralizing MAbs IgG1b12, 2G12, 2F5 and 4E10. It also hypothesizes that some broadly reactive Abs might not be routinely made because they are derived from B cell populations that frequently make polyspecific Abs and are thus subjected to B cell negative selection. Different types of anti-MPER Abs are discussed, including 13H11. Haynes *et al.* [2005b] (**antibody generation**, **antibody interactions**, **review**)

Keywords antibody generation, antibody sequence variable domain, neutralization

- 13K3: 13K3 was derived from a rabbit Fab phage display library prepared using the bone marrow RNA extracted from N35ccg-N13 immunized rabbits. The library was screened with N35ccg-N13 peptide, which is a soluble homotrimer corresponding to the HIV-1 gp41 N-heptad repeat (NHR) region. The CDR H3 region of 13K3 was 12 residues in length. 13K3 did not neutralize HIV-1 HXB2. Unlike neutralizing Abs in this study, whose heavy chain variable regions were encoded by a rarely expressed VH gene, the non-neutralizing Ab 13K3 was encoded by the usually expressed VH1a1 gene. - 2.10H: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. 2.10H belonged to the group 2 MAbs, which are able to bind subtype B but not subtype C gp120, and are able to bind both V3 peptides. For subtype B, 2.10H required an R18 residue in order to bind, but the binding was not significantly affected by the H13R change. For subtype C, Q18R mutation did not restore binding to gp120, but the R13H-Q18R double mutation did. Peptide binding was affected only by the R13H mutation, indicating that the poor binding of Q18R gp120 mutant has a structural basis. 2.10H was not able to neutralize JR-FL nor SF162 isolates. However, a chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. - 2601: This MAb was derived from plasma from a patient with env clade A virus with the GPGQ V3 motif. When cross-reactivity was tested, this Ab bound to the V3subtypeA-fusion protein containing GPGQ motif and not to V3subtypeB-fusion protein containing GPGR motif. This Ab was also shown to be able to neutralize clade C psMW965 (GPGQ) but not clade B psSF162 (GPGR) virus and only one subtype B and three non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 2601: This Ab did not neutralize SF162 but the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, no neutralization was observed of the SF162(JR-FL V1/V2) and the SF162(JR-FL V1/V2/V3) variants. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, H, C and CRF02_AG) except CRF01_AE. This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different clades except A1, indicating effective V1/V2-mediated masking of somel HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2601: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B V3s. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. 2601 was derived from a person infected with a clade A or CRF02 virus, and binds to A but not to B V3 loops.Neutralization of JR-FL and SF162(UG V3) by anti-V3 MAbs 2557, 2558, 2601, but not subtype A primary isolates despite binding to the subtype A V3 loops, suggested masking by V1V2 blocking of neutralization by these antibodies. Krachmarov *et al.* [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 2909: Replacing V3 domain of SF162, which is neutralized by 2909, with V3 from different HIV-1 clades resulted in significant reductions in sensitivity to neutralization by this antibody. However, the only variant totally resistant was CRF01_AE. The main requirement for reactivity of 2909 in V2 was a rare polymorphism at position 160 or 161, and to a lesser extent at positions 167 and 169. It was also found that the neutralization sensitive SF162 variant actually expressed a suboptimal form of 2909 epitope where a mutation N167D resulted in more robust neutralization. Position 167 in V2 dictates the specificities of three type-specific neutralizing MAbs that bind to an otherwise realtively conserved epitope in involving V2: 2909, C108g, and 10/76b. Honnen *et al.* [2007] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 2909: The neutralizing activity of V1 and V2 Abs, such as mAb 2909, is reviewed. Pantophlet & Burton [2006] (**antibody binding site definition and exposure**, **neutralization**)
- 2909: 2909 is a NAb that was produced by fusion of heteromyeloma SHM-D33 with Epstein-Barr virus transformed PBMC and selection by a neutralization assay. The PBMC were derived from an HIV-1 infected individual who maintained a low viral load after 15 years of infection with no therapy. The MAb very potently neutralizes SF162, but has a narrow range of activity, and did not neutralize autologous virus, nor primary isolates from clade A (VI191, CA1, and 92RW021),clades B (BX08, CA5, and BaL), clade C (95ZW2036) and clade F (CA20 and 93BR029). Sequence analysis of the variable domain of the heavy chain of 2909 shows that it is comprised of IgHV3-43, IgHJ6, and IgHD5-12. 2909 recongizes a quartenary structure present on intact SF162 virions and does not bind to soluble or recombinant Envelope proteins. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670 (anti-C5), 1418 (irrelevant control MAb), nor 2G12 (anti-carbohydrate); in fact, 2G12 enhanced 2909 binding. Gorny *et al.* [2005] (**antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**, **antibody sequence variable domain**)

- 2G12: UK Medical Research council AIDS reagent: ARP3030.
- 2G12: NIH AIDS Research and Reference Reagent Program: 1476.
- 2G12: Neutralization susceptibility of CRF01_AE Env-recombinant viruses, derived from blood samples of Thai HIV-1 infected patients in 2006, was tested to 2G12. Most of the 35 viruses tested replicated efficiently in the presence of 2G12, in spite of highly conserved PNLG sites recognized by this Ab, indicating that CRF01_AE is not susceptible to neutralization by 2G12. These results suggest that the protein structure , including conformation of the CD4 binding domain, may somehow be different between CRF01_AE and subtype B Env gp120. Utachee *et al.* [2009] (**neutralization**)
- 2G12: The study explores the development of a carbohydrate immunogen that could elicit 2G12-like neutralizing ABs to contribute to an AIDS vaccine. Specifically, the study describes the development of neoglycoconjugates displaying variable copy numbers of synthetic tetramannoside (Man(4) on bovine serum albumin (BSA) molecules by conjugation to Lys residues. Immunization of rabbits with BSA-(Man(4))(14) elicits significant serum Ab titers to Man(4). However, these Abs are unable to bind gp120. Astronomo *et al.* [2008] (**vaccine antigen design**)
- 2G12: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. In competitive virus capture assays on 2G12 coated plates, some of the subtype B plasmas, and two of the subtype C plasmas, inhibited virus capture. Mutant versions of JR-FL trimers were designed to selectively eliminate neutralization epitopes, but the plasma titers against the 2G12-eliminated mutant were similar to those against the wildtype. This indicated that very few, if any, 2G12-like Abs were present in the plasmas, and that a fraction of patients developed Abs that overlap the 2G12 epitope but do not neutralize the virus. Binley *et al.* [2008] (**neutralization**, **binding affinity**)
- 2G12: Three constructs of the outer domain (OD) of gp120 of subtype C, fused with Fc, were generated for immunization of mice: OD(DL3)-Fc (has 29 residues from the centre of the V3 loop removed), OD(2F5)-Fc (has the same deletion reconstructed to contain the sequence of 2F5 epitope), and the parental OD-Fc molecule. All OD variants contained substitutions at residues 295 and 394 that reintroduced the 2G12 epitope into the used sequence. All three OD-variants reacted with 2G12, indicating that the isolated outer domain is conformationally immobile. Despite the presence of the 2G12 epitope, none of the sera from mice immunized with the three OD-constructs showed 2G12-like reactivity. Chen *et al.* [2008a] (**vaccine antigen design**)
- 2G12: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. All viruses expressing the WT Envs were susceptible to neutralization by 2G12. Replacement of the V1 loops by that of SF162 did not alter the neutralization susceptibilities of the viruses. Ching *et al.* [2008] (**neutralization**)
- 2G12: The goal of the study was to measure nAb responses in patients infected with HIV-1 prevalent subtypes in China. g160 genes from plasma samples were used to establish a pseudovirus-based neutralization assay. 2G12 neutralized 33% of subtype B clones but not subtype BC and AE clones. Chong *et al.* [2008] (**neutralization**, **subtype comparisons**)
- 2G12: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs, 2G12 in particular, and sCD4 were able to shift JR-FL trimers. In contrast, most non-neutralizing Fabs bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. For 2G12, there was a ladder of partially and fully liganded trimers Crooks *et al.* [2008] (**neutralization**, **binding affinity**)
- 2G12: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. There was no difference in 2G12 binding to wild type and mutant JR-FL, and 2G12 inhibited infection of the two pseudoviruses with comparable potencies. Dey *et al.* [2008] (**binding affinity**)
- 2G12: Variable domains of three heavy chain Abs, the VHH, were characterized. The Abs were isolated from llamas, who produce immunoglobulins devoid of light chains, immunized with HIV-1 CRF07_BC, to gp120. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. 2G12 provided some inhibition of binding of the three neutralizing VHH Abs to gp120, suggesting that 2G12 imposes steric hinderance to binding of the VHH Abs to gp120. Forsman *et al.* [2008] (**binding affinity**)
- 2G12: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied using preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations. MAb 2G12 was used to analyze antigenic properties of construct 92UG-gp140-Fd, derived from isolate 92UG037.8 and stabilized by a C-terminal foldon tag. 92UG-gp140-Fd binds 2G12 with high affinity. Frey *et al.* [2008] (**binding affinity**)
- 2G12: A series of peptide conjugates were constructed via click reaction of both aryl and alkyl acetylenes with an internally incorporated azidoproline 6 derived from parent pep-

B Cell

tide RINNIPWSEAMM. Many of these conjugates exhibited increase in both affinity for gp120 and inhibition potencies at both the CD4 and coreceptor binding sites. None of the high affinity peptides inhibited the interactions of YU2 gp120 with 2G12 Ab. The aromatic, hydrophobic, and steric features in the residue 6 side-chain were found important for the increased affinity and inhibition of the high-affinity peptides. Gopi *et al.* [2008]

- 2G12: Mab 2G12 binds to gp120 and is essentially inactive after CD4 engagement, with a neutralization half-life of less than 1 minute. Thus, the binding site for 2G12 on gp120 is unavailable once the CD4-induced conformational changes in gp120 have occurred. Gustchina *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **kinetics**)
- 2G12: This review summarizes the obstacles that stand in the way of making a successful preventive HIV-1 vaccine, such as masked or transiently expressed Ab epitopes, polyclonal B-cell class switching, and inefficient, late, and not sufficiently robust mucosal IgA and IgG responses. Possible reasons why HIV-1 envelope constructs expressing 2G12 epitope fail to induce broadly neutralizing Abs are discussed. Haynes & Shattock [2008] (**vaccine antigen design**, **review**)
- 2G12: Synergy of 2F5 with MAbs 2G12, D5, and peptide C34 was examined. 2G12 exhibited synergy in inhibition of HIV-1 89.6 with MAb 2F5. 2G12 was not as synergistic when combined with D5 as 2F5 was. Hrin *et al.* [2008] (**antibody interactions**)
- 2G12: A divalent Man9ClcNAc2 glycopeptide, that binds to 2G12, was covalently coupled to the OMPC carrier and used as immunogen to test its efficacy to induce 2G12-like neutralizing Ab response. High levels of carbohydrate-specific Ab were induced in both guinea pigs and rhesus macaques, but these Ab showed poor recognition of recombinant gp160 and failed to neutralize a panel of subtype B isolates. Sera from HIV-1 positive individuals was tested for binding to the synthetic antigen but failed to recognize the mimetics, although two of the patients showed presence of 2G12-like Abs. These results suggest that presentation of Man9ClcNAc2 on the constrained cyclic scaffold is insufficient to induce a polyclonal response that recognizes native 2G12 epitope. Joyce *et al.* [2008] (**mimotopes**, **neutralization**, **vaccine antigen design**)
- 2G12: A mathematical model was developed and used to derive transmitted or founder Env sequences from individuals with acute HIV-1 subtype B infection. All of the transmitted or early founder Envs were sensitive to neutralization by 2G12. Keele *et al.* [2008] (**neutralization**, **acute/early infection**)
- 2G12: A yeast strain was produced (TM) with a deletion of genes encoding two key carbohydrate processing enzymes, Och1 and Mnn1, that resulted in efficient recognition of the TM yeast by 2G12 mAb. Four heavily glycosylated yeast proteins were isolated that supported 2G12 binding.Removal of high-mannose-type N-linked carbohydrates from the proteins resulted in loss of 2G12 recognition. Sera from rabbits immunized with TM yeast cells contained Abs that could cross-react with HIV-1 gp120 and that recognized a variety of clade B, C and SIV gp120 proteins. Like 2G12, binding of these Abs to Env proteins was abrogated by removal of N-linked high mannose glycans. The elicited Abs had 50-100-fold lower gp120 binding activity than 2G12, and the antiserum recognized a larger variety of mannose-dependent epitopes. There was no observed neutralizing activity of the sera. The results indicate that immunizations with TM yeast can elicit 2G12-like Abs. Luallen *et al.* [2008] (**vaccine antigen design**)
- 2G12: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. Binding of 2G12 to gp120SF162 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with intact 2G12 epitope. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Binding of 2G12 to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **binding affinity**)
- 2G12: A peptide 2G12.1, that binds to 2G12, was derived by screening of phage-displayed peptide libraries with 2G12. Comparison of the crystal structure of the Fab 2G12 bound to 2G12.1 peptide, and 2G12 bound to carbohydrate, revealed that 2G12 binding to peptide and carbohydrate occurs through different Ab interactions. The 2G12.1 peptide occupied a site different from, but adjacent to, the primary carbohydrate binding site on 2G12. Thus, this does not support structural mimicry of the peptide to the native carbohydrate epitope on gp120. In addition, the 2G12.1 peptide was not an immunogenic mimic of the 2G12 epitope either, since the sera from mice immunized with the peptide did not bind gp120. Menendez *et al.* [2008] (**mimics**, **structure**)
- 2G12: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. In addition, preneutralization of X4 virus with 2G12 prior to capture efficiently blocked transmission to 36%, while transmission of R5 was blocked to 63%, indicating that 2G12 treatment results in more efficient transfer of X4 than of R5 HIV-1. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)
- 2G12: Contemporaneous biological clones of HIV-1 were isolated from plasma of chronically infected patients and tested for their functional properties. The clones showed striking functional diversity both within and among patients, including differences in infectivity and sensitivity to inhibition by 2G12. There was no correlation between clonal virus infectivity and sensitivity to 2G12 inhibition, indicating that these properties are dissociable. The sensitivity to 2G12 inhibition was, however, a property shared by viruses from a given patient, suggesting that the genetic determinants that define this sensitivity may lie in regions that are not necessarily subject to extensive diversity. Nora *et al.* [2008] (**neutralization**)
- 2G12: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. 2G12 was used as control in neu-

tralization assays, and was able to neutralize JR-FL and SF162 isolates, as well as a chimeric SF162 variant with a JR-FL-like V3 sequence. Patel *et al.* [2008] (**neutralization**)

- C2G12: Neutralization of HIV-1 IIIB LAV isolate by 2G12 was within the same range as the neutralization of the virus by natural antibodies from human sera against the gal(α1,3)gal disaccaride linked to CD4 gp120-binding peptides, indicating that the activity of natural antibodies can be re-directed to neutralize HIV-1. Perdomo *et al.* [2008] (**neutralization**)
- 2G12: The sensitivity of R5 envelopes derived from several patients and several tissue sites, including brain tissue, lymph nodes, blood, and semen, was tested against a range of inhibitors and Abs targeting CD4, CCR5, and various sites on the HIV envelope. All but one envelopes from brain tissue were macrophage-tropic while none of the envelopes from the lymph nodes were macrophage-tropic. Macrophage-tropic envelopes were also less frequent in blood and semen. There was a clear variation in sensitivity to 2G12, where most envelopes were sensitive, while some were resistant to neutralization by this Ab. There was a significant correlation between increased envelope macrophage-tropism and decreased 2G12 sensitivity. It is suggested that the macrophage-tropic brain variants are less protected by glycosylation due to absence of Abs in the brain, thus lacking N-glycosylation sites critical for 2G12 neutralization. Three of nine brain envelopes were resistant to 2G12, while only one of nine lymph node envelopes were resistant to 2G12. Peters *et al.* [2008b] (**antibody binding site definition and exposure**, **neutralization**)
- 2G12: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by 2G12, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. D1/85.16, but not CC101.19 escape variant, was markedly more sensitive to neutralization by 2G12 (∼50-fold). As 2G12 had no significantly higher affinity for gp120 from D1/85.16, the increased sensitivity of this virus is most likely due to alternation in the conformation or accessibility of the 2G12 epitope on its Env trimer. Overall, the study suggests that CCR5 inhibitor-resistant viruses are likely to be somewhat more sensitive to neutralization than their parental viruses. Pugach *et al.* [2008] (**co-receptor**, **neutralization**, **escape**, **binding affinity**)
- 2G12: Maize was evaluated as a potential inexpensive large-scale production system for therapeutic antibodies against HIV. 2G12 was expressed in maize endosperm. In vitro cell assays demostrated that the HIV-neutralizing properties of the maize-produced 2G12 MAb were equivalent to those of Chinize hamster ovary cell-derived MAb 2G12. Rademacher *et al.* [2008]
- 2G12: The neutralization profile of early R5, intermediate R5X4, and late X4 viruses from a rhesus macaque infected with SHIV-SF162P3N was assessed. 2G12 neutralized all three viruses with similar low potency. Tasca *et al.* [2008] (**co-receptor**, **neutralization**)
- 2G12: An R5 HIV variant, in contrast to its parental virus, was shown to infect T-cell lines expressing low levels of cell surface CCR5 and to infect cells in the absence of CD4. The variant was neutralized less efficiently by 2G12 than the parental virus, indicating conformational changes in gp120. These properties of the mutant virus were determined by alternations in gp41. Taylor *et al.* [2008] (**co-receptor**, **neutralization**)
- 2G12: To investigate B-cell responses immediately following HIV-1 transmission, Env-specific Ab responses to autologous and consensus Envs in plasma donors were determined. Broadly neutralizing Abs with specificity similar to 2G12 did not appear during the first 40 days after plasma virus detection. Tomaras *et al.* [2008] (**antibody generation**, **acute/early infection**)
- 2G12: Sera from both gp120 DNA prime-protein boost immunized rabbits and from protein-only immunized rabbits did not compete for binding to 2G12, indicating no elicitation of 2G12-like Abs by either of the immunization regimens. Vaine *et al.* [2008] (**vaccine antigen design**)
- 2G12: Concentrations of neutralizing Abs in long-term nonprogressors (LNTPs) were significantly higher than the concentrations in asymptomatic subjects and subjects with AIDS, with no statistically significant difference between the two latter groups. Amino acid substitutions in the 2G12 epitope were found in both asymptomatic subjects and subjects with AIDS, while no such mutations were found among LNTPs. Eight different mutations were found at five N-glycosylation linked sites: 295V/T/D/K, 297I, 332E. 334N, and 386D. The mutation rates of the conserved 2G12 neutralization epitopes were significantly different among LNTPs, asymptomatic patients, and patients with AIDS. Wang *et al.* [2008] (**escape**, **rate of progression**)
- 2G12: The various effects that neutralizing and non-neutralizing anti-envelope Abs have on HIV infection are reviewed, such as Ab-mediated complement activation and Fc-receptor mediated activities, that both can, through various mechanisms, increase and decrease the infectivity of the virus. The importance of these mechanisms in vaccine design is discussed. The unusual features of the 2G12 MAb, and its neutralization capacities, are described. Willey & Aasa-Chapman [2008] (**neutralization**, **review**)
- 2G12: Current insights into CTLs and NAbs, and their possible protective mechanisms against establishment of persistent HIV/SIV infection are discussed. Pre- and post-infection sterile and non-sterile protection of NAbs against viral challenge, and potential role of NAbs in antibody-mediated antigen presentation in modification of cellular immunity, are reviewed. Use of 2G12 in immunization experiments and its in vivo antiviral activity in suppression of viral rebound in HIV-1 infected humans undergoing structured treatment interruptions are described. Yamamoto & Matano [2008] (**immunotherapy**, **supervised treatment interruptions (STI)**, **review**)
- 2G12: 2G12 did not neutralize a clade C SHIV strain in the TZM-bl based assay. Zhang *et al.* [2008] (**neutralization**)
- 2G12: Crabohydrate-binding agents, including 2G12, are reviewed regarding to their antiviral activity, resistance development, and their potential use as therapeutic agents. Balzarini [2007] (**review**)

- 2G12: This Ab was found to be able to bind to a highly stable trimeric rgp140 derived from a HIV-1 subtype D isolate containing intermonomer V3-derived disulfide bonds and lacking gp120/gp41 cleavage. Billington *et al.* [2007]
- 2G12: Pseudoviruses derived from gp120 Env variants that evolved in multiple macaques infected with SHIV 89.6P displayed a range of degrees of virion-associated Env cleavage. Pseudoviruses with higher amount of cleaved Env were more sensitive to neutralization by 2G12, as they contained peripheral glycan N386, not present in the wildtype 89.6P. Blay *et al.* [2007] (**neutralization**)
- 2G12: 15 subtype A HIV-1 envelopes from early in infection were not neutralized by 2G12, likely because of a deletion or shift in one or more of the 5 glycosylation sites associated with 2G12 recognition. SF162 was neutralized as expected. Blish *et al.* [2007] (**neutralization**, **acute/early infection**, **subtype comparisons**)
- 2G12: Yeast display was compared to phage display and shown to select all the scFv identified by phage display and additional novel antibodies. Biotinylated C11 and 2G12 were used to minimize selection of non-gp120 specific clones from the yeast displayed antibody library; these MAbs were used as they have unique epitopes with limited overlap with with most known epitopes. Bowley *et al.* [2007] (**assay standardization/improvement**)
- 2G12: Increased neutralization sensitivity was observed for (R5)X4 viruses from timepoints both early and late after emergence of X4 compared to their coexisting R5 variants in one patient, and only for the early (R5)X4 viruses in another patient. In a third patient, in contrast, late (R5)X4 viruses were found to be significantly more resistant to 2G12 neutralization than their coexisting R5 variants. Bunnik *et al.* [2007] (**co-receptor**, **neutralization**)
- 2G12: 2 glycosylation site additions to asparagines 295 and 392 on the clade C gp120 backbone (gp120CN54+) were used to reconstruct the 2G12 epitope, as the gp120CN54+ construct showed excellent reactivity with 2G12. gp120CN54+ and an Fc tagged outer domain of gp120 (ODCN54+-Fc) bound equally well to 2G12, while Fc fusion to gp120CN54+ reduced 2G12 binding, indicating partial occlusion of the 2G12 epitope. Chen *et al.* [2007a] (**antibody binding site definition and exposure**, **binding affinity**)
- 2G12: 2G12-blocking activity was very low in all of the sera from guinea pigs immunized with gp120 protein, or with three types of VLPs: disulfide-shackled functional trimers (SOS-VLP), uncleaved nonfunctional Env (UNC-VLP), naked VLP bearing no Env. Crooks *et al.* [2007] (**neutralization**, **vaccine antigen design**)
- 2G12: Macaques were immunized with either CD4, gp120, cross-linked gp120-human CD4 complex (gp120-CD4 XL), and with single chain complex containing gp120 rhesus macaque CD4 domains 1 and 2 (rhFLSC). Sera from the rhFLSC immunized animals showed slightly higher competition titers, being able to block gp120-CD4 complex interactions with 2G12 slightly more efficiently than sera from animals immunized with the three other proteins. DeVico *et al.* [2007] (**neutralization**)
- 2G12: gp120 proteins were developed with double mutation T257S+S375W, which alters the cavity at the epicenter of the CD4 binding region, and used to immunize rabbits. The ability of rabbit sera to affect binding of CD4 to unmodified gp120 proteins was tested. CD4 binding to gp120 was unaffected by 2G12. Dey *et al.* [2007b] (**antibody binding site definition and exposure**)
- 2G12: SOSIP Env proteins are modified by the introduction of a disulfide bond between gp120 and gp41 (SOS), and an I559P (IP) substitution in gp41, and form trimers. The KNH1144 subtype A virus formed more stable trimers than did the prototype subtype B SOSIP Env, JRFL. The stability of gp140 trimers was increased for JR-FL and Ba-L SOSIP proteins by substituting the five amino acid residues in the N-terminal region of gp41 with corresponding residues from KNH1144 virus. b12, 2G12, 2F5, 4E10 and CD4-IgG2 all bound similarly to the WT and to the stabilized JRFL SOSIP timers, suggesting that the trimer-stabilizing substitutions do not impair the overall antigenic structure of gp140 trimers. Dey *et al.* [2007a]
- 2G12: This Ab was used to help define the antigenic profile of envelopes used in serum depletion experiments to attempt to define the neutralizing specificities of broadly cross-reactive neutralizing serum. It bound to JR-FL and JR-CSF gp120 monomers and to a lesser extent to core JR-CSF gp120 monomer. Dhillon *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**)
- 2G12: A D386N change in the V4 region, which results in restoration of N-glycosylation at this site, did not have any impact on the neutralization of a mutant virus by 2G12 compared to wildtype. Also, there was no association between increased sensitivity to 2G12 neutralization and enhanced macrophage tropism. Dunfee *et al.* [2007] (**antibody binding site definition and exposure**)
- 2G12: Newborn macaques were challenged orally with the highly pathogenic SHIV89.6P and then treated intravenously with a combination of IgG1b12, 2G12, 2F5 and 4E10 one and 12 hours post-virus exposure. All control animals became highly viremic and developed AIDS. In the group treated with mAbs 1 hour post-virus exposure, 3/4 animals were protected from persistent systemic infection and one was protected from disease. In the group treated with mAbs 12 hour post-virus exposure, one animal was protected from persistent systemic infection and disease was prevented or delayed in two animals. IgG1b12, 2G12, and 4E10 were also given 24 hours after exposure in a separate study; 4/4 treated animals become viremic, but with delayed and lower peak viremia relative to controls. 3/4 treated animals did not get AIDS during the follow up period, and 1 showed a delayed progression to AIDS , while the 4 untreated animals died of AIDS. Thus the success of passive immunization with NAbs depends on the time window between virus exposure and the start of immunoprophylaxis. Ferrantelli *et al.* [2007] (**immunoprophylaxis**)
- 2G12: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to 2G12 and other MAbs. Antibodies induced by immunization with these centralized proteins did not, however, have the breadth and potency compared to that of 2G12 and other broadly neu-

tralizing MAbs. Gao *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)

- 2G12: Addition of a glycosylation site at position V295N in three different subtype C envelope clones (COT9.6, COT6.15 and Du151.2) resulted in increase in binding of 2G12. However, only one of the viral clones (COT9.6) became sensitive to neutralization by 2G12 at high Ab concentrations. Introduction of glycosylation site at position 448 in COT6.15 further increased its binding to 2G12 and resulted in viruses more sensitive to neutralization. Furthermore, addition of glycosylation at position 442 increased binding and neutralization sensitivity of the corresponding viruses to 2G12, and deletion of glycosylation at position 386 resulted in reduction in binding and resistance to neutralization by 2G12. Gray *et al.* [2007b] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**, **subtype comparisons**)
- 2G12: Controlled attachment of Ab-bound HIV to cells was not affected by the presence of this Ab. However, the virus was still efficiently neutralized indicating that binding of 2G12 to the cell-free virus interferes with a step of infection subsequent to cell attachment. Haim *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **kinetics**)
- 2G12: A recombinant gp120-Fc bound to 2G12, indicating it was conformationally intact. 2G12 binding to gp120 was inhibited by the soluble recombinant extracellular domain (ECD) of DC-SIGN in a dose-dependent fashion, but 2G12 did not inhibit binding of gp120 to DC-SIGN. Many single, double, and triple N-glycan mutations in the 2G12 epitope did not affect binding of gp120 to DC-SIGN, however, some of the N-glycan sites within the 2G12 epitope were shown to be optimally positioned to significantly contribute to DC-SIGN binding. Thus, it is suggested that DC-SIGN can bind to a flexible combination of N-glycans on gp120, both within and outside of the 2G12 epitope, but that its optimal binding site overlaps with specific N-glycans within the 2G12 epitope. Hong *et al.* [2007] (**binding affinity**)
- 2G12: The neutralizing activity of this antibody for the JR-FL Env variant with the N160K/E160K mutations was measured in comparison with the neutralizing activity of 2909, which was found to be higher. Honnen *et al.* [2007] (**neutralization**, **variant cross-recognition or cross-neutralization**)
- 2G12: HIV-1 env clones resistant to cyanovirin (CV-N), a carbohydrate binding agent, showed amino acid changes that resulted in deglycosylation of high-mannose type residues in the C2-C4 region of gp120. Compared to their parental virus HIV-1 IIIB, these CV-N resistant viruses were also completely resistant to 2G12, as they lost one or more 2G12 binding glycans on gp120. Hu *et al.* [2007] (**neutralization**, **escape**)
- 2G12: Binding of 2G12 to gp120 was not significantly affected by the small molecule HIV-1 entry inhibitor IC9564. IC9564 induces conformational change of gp120 to allow CD4i antibody 17b to bind, but inhibits CD4-induced gp41 conformational changes. Huang *et al.* [2007b] (**antibody binding site definition and exposure**)
- 2G12: This review summarizes current knowledge on the various functional properties of antibodies in HIV-1 infection, including 2G12 mAb, in vivo and in vitro activity of neutralizing Abs, the importance and downfalls of non-neutralizing Abs and antibodies that mediate antibody-dependent cellular cytotoxicity and the complement system, and summarizes data on areas tht need future investigation on Ab-mediated immune control. Huber & Trkola [2007] (**review**)
- 2G12: Cross-neutralization was limited in this study. 2G12 neutralized subtype A strain UG273 and subtype B strains US2, NL4-3, and IIIB. It did not neutralize subtype C strain ETH2220, subtype D UG270, CRF01 A/E ID12; subtype F BZ163; nor subtype G BCF06. 3 HIV-2 strains and SIVmac 251 were also not neutralized. 2G12 bound to MN and NDK, but did not neutralize them. Neutralization resistance was selected in culture using strains NL43 and IIIB. NL43 escaped via loss of the glycosylation sequon at positions 295-297, IIIB escaped via sequon losses at positions 392-394 and 295-297, or 406-408, as expected from earlier studies defining critical mannose residues for 2G12 binding. The loss of the mannose actually enhanced mannose-specific lectin inhibition of the virus. Huskens *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **escape**, **subtype comparisons**)
- 2G12: A new high throughput method was developed for neutralization analyses of HIV-1 env genes by adding cytomegalovirus (CMV) immediate enhancer/promoter to the 5' end of the HIV-1 rev/env gene PCR products. The PCR method eliminates cloning, transformation, and plasmid DNA preparation steps in the generation of HIV-1 pseudovirions and allows for sufficient amounts of pseudovirions to be obtained for a large number of neutralization assays. Pseudovirions generated with the PCR method showed similar sensitivity to 2G12 Ab, indicating that the neutralization properties are not altered by the new method. Kirchherr *et al.* [2007] (**assay development**, **neutralization**)
- 2G12: Four consensus B Env constructs: full length gp160, uncleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective uncleaved version mediated infection using the CCR5 coreceptor. Primary isolate Envs were completely resistant or just somewhat sensitive to neutralization by 2G12 while the consensus B constructs were sensitive. Thus the 2G12 epitope is present on the consensus B Env glycoprotein and was not influenced by the Env modifications in this study. Kothe *et al.* [2007] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)
- 2G12: This review summarizes 2G12Ab epitope, properties and neutralization activity. 2G12 use in passive immunization studies in primates and possible mechanisms explaining protection against infection are discussed. Kramer *et al.* [2007] (**immunotherapy**, **review**)
- 2G12: G1 and G2 recombinant gp120 proteins, consisting of 2F5 and 4E10, and 4E10 epitopes, respectively, engrafted into the V1/V2 region of gp120, were tested as an immunogen to see if they could elicit MPER antibody responses. Deletion of V1/V2 from gp120 or its replacement with G1 and G2 grafts, did not greatly affect binding of 2G12 to gp120. Shortening of the N and C termini of the V3 loop nearly abolished binding of 2G12. Law *et al.* [2007] (**vaccine antigen design**)
- 2G12: 32 human HIV-1 positive sera neutralized most viruses from clades A, B, and C. Two of the sera stood out as par-

B Cell

ticularly potent and broadly reactive. Two CD4-binding site defective mutant Env proteins were generated to evaluate whether Abs to the CD4-binding site are involved in the neutralizing activity of the two sera. The integrity of the wildtype and mutant proteins was tested for their reactivity to 2G12. Li *et al.* [2007b] (**binding affinity**)

- 2G12: 2G12 structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit 2G12-like Abs, are reviewed in detail. Lin & Nara [2007] (**vaccine antigen design**, **review**, **structure**)
- 2G12: MBL, a lectin present in human serum that recognizes mannose-rich N-glycans, was shown to mediate increased HIV-1 infectivity, and to reduce 2G12-mediated neutralization of HIV-1. Marzi *et al.* [2007] (**neutralization**)
- 2G12: A chimeric protein entry inhibitor, L5, was designed consisting of an allosteric peptide inhibitor 12p1 and a carbohydrate-binding protein cyanovirin (CNV) connected via a flexible linker. The L5 chimera inhibited 2G12-gp120 interaction, as did CNV alone, indicating that the chimera has the high affinity binding property of the CNV molecule. McFadden *et al.* [2007]
- 2G12: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, a summary of the neutralizing activity of mAb 2G12 in different HIV-1 clades is provided. McKnight & Aasa-Chapman [2007] (**variant cross-recognition or cross-neutralization**, **review**)
- 2G12: Three MAbs, 2G12, 4E10 and 2F5, were administered to ten HIV-1 infected individuals treated with ART during acute and early infection, in order to prevent viral rebound after interruption of ART. MAb infusions were well tolerated with essentially no toxicity. Viral rebound was not prevented, but was significantly delayed in 8/10 patients. 2G12 activity was dominant among the MAbs used. Baseline susceptibility to 2G12 was inversely correlated with the time to viral rebound. Escape from 2G12 was associated with viral rebound. Long-term suppression of viremia was achieved in 3/10 patients. Mehandru *et al.* [2007] (**escape**, **immunotherapy**, **supervised treatment interruptions (STI)**)
- 2G12: 2G12-neutralized HIV-1 captured on Raji-DC-SIGN cells or immature monocyte-derived DCs (iMDDCs) was successfully transfered to CD4+ T lymphocytes, indicating that the 2G12-HIV-1 complex was disassembled upon capture by DC-SIGN-cells. van Montfort *et al.* [2007] (**neutralization**, **dendritic cells**)
- 2G12: HIV-1 passaged in the presence of chloroquine was observed to have lost two glycosylation sites imporatnt for 2G12 binding, at positions 332 and 397 in the gp120 region, indicating that the drug can alter the immunogenic properties of gp120. Naarding *et al.* [2007]
- 2G12: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. 2G12 structure and binding to HIV-1 envelope and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, such as 2G12, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- 2G12: The ability of 2G12 to neutralize recently transmitted viruses was examined in four homosexual and two parenteral transmission couples. The vast majority of recently transmitted viruses from homosexual recipients were resistant to neutralization by 2G12, although viruses isolated later in the course of infection showed increased sensitivity to 2G12 in one of the patients. In the parenteral transmission, one of the recipients had early viruses resistant to 2G12 neutralization, and one had viruses somewhat sensitive to 2G12 neutralization. The neutralization sensitivity patterns of recipient viruses to 2G12 did not correlate to the neutralization sensitivity patterns of their donors in the homosexual couples, while the HIV-1 variants from the one of the two parenteral pairs were similarly resistant to neutralization by 2G12. 12% of 2G12 resistant viruses had all five PNGS of the 2G12 epitope. 88.5% of the 2G12 resistant viruses lacked at least one of the five PNGS, and viruses isolated later in infection that had become sensitive to 2G12 neutralization had restored the 2G12 epitope. Quakkelaar *et al.* [2007b] (**neutralization**, **acute/early infection**, **mother-to-infant transmission**)
- 2G12: Neutralization sensitivity of maternal and infant viruses to 2G12 close to transmission timepoint was shown to be poor. Even the viruses from one mother, that were shown to be sensitive to maternal Abs and pooled plasma, were not neutralized by 2G12, indicating that Abs in plasma are not directed to this Ab epitope. Rainwater *et al.* [2007] (**neutralization**, **mother-to-infant transmission**)
- 2G12: Chemical inhibition of mammalian glycoprotein synthesis with the plant alkaloid kifunensine resulted in an abundance of oligomannose-type glycans on the cell surface, and binding of 2G12 to previously non-antigenic self proteins and cells. Expression of gp120 in the presence of kifunensine also increased both binding and valency of gp120 to 2G12. Scanlan *et al.* [2007] (**antibody binding site definition and exposure**, **binding affinity**)
- 2G12: A reference panel of recently transmitted Tier 2 HIV-1 subtype B envelope viruses was developed representing a broad spectrum of genetic diversity and neutralization sensitivity. The panel includes viruses derived from male-to-male, female-to-male, and male-to-female sexual transmissions, and CCR5 as well as CXCR4 using viruses. The envelopes displayed varying degrees of neutralization sensitivity to 2G12, with 11 of 19 enevlopes sensitive to neutralization by this Ab. Schweighardt *et al.* [2007] (**neutralization**, **assay standardization/improvement**)
- 2G12: Pre-treatment of gp120 with 2G12 strongly inhibited induction of IL-10, indicating that interaction between gp120 and a mannose C-type lectin receptor is a critical trigger for IL-10 induction. Shan *et al.* [2007]
- 2G12: This Ab was used in the analysis of clade C gp140 (97CN54) antigenicity and was shown not to bind to this molecule, as the glycan epitope is absent. Sheppard *et al.* [2007b] (**binding affinity**)
- 2G12: Modeling of protein-protein interaction based on the gp120 crystal structure, X-ray crystal structure of 2G12 and its

complexes with glycans, suggested that the glycans attached to N295 and N302 from the V3 loop are the two most likely involved in the conformational epitope of 2G12. Sirois *et al.* [2007] (**review**, **structure**)

- 2G12: Infusion of a MAb cocktail (4E10, 2G12 and 2F5) into HIV-1 infected subjects was shown to be associated with increased levels of serum anti-cardiolipin and anti-phosphatidylserine Ab titers, and increased coagulation times. In the absence or in the presence of adult and neonate plasma, 2G12 did not bind to either phosphatidylserine nor to cardiolipin, and did not induce significant prolongations of clotting times in human plasma, indicating that infusion of 2G12 was not responsible for autoreactivity and prolonged clotting times. Vcelar *et al.* [2007] (**antibody interactions**, **autoantibody**, **binding affinity**, **immunotherapy**)
- 2G12: Synthetic monomeric D1 arm oligosaccharide, corresponding to the D1 arm of Man9 which has a high affinity to 2G12, and its fluorinated derivative interacted with 2G12 only weakly. However, when four units of synthetic D1 arm tetrasaccharide were introduced to a cyclic decapeptide template, it showed high affinity to 2G12. Introduction of two T-helper epitopes onto the template did not affect 2G12 binding, indicating that the construct could be used as a new type of immunogen for raising carbohydrate-specific neutralizing Abs against HIV. Wang *et al.* [2007b] (**mimotopes**, **vaccine antigen design**, **kinetics**, **binding affinity**)
- 2G12: Novel approaches based on sequential (SAP) and competitive (CAP) antigen panning methodiologies, and use of antigens with increased exposure of conserved epitopes, for enhanced identification of broadly cross-reactive neutralizing Abs are reviewed. Previously known broadly neutralizing human mAbs are compared to Abs identified by these methods. Zhang & Dimitrov [2007] (**review**)
- 2G12: 2G12 did not inhibit binding of Fc-gp120 to CD4, however, it inhibited binding of Fc-gp120, and of the virus itself, to the CCR5 coreceptor and to the DC-SIGN. Thus 2G12 probably inhibits HIV-1 by two mechanisms: blocking of gp120-CCR5 and of gp120-DC-SIGN interactions. Pre-incubation of virus with sCD4 did not affect its neutralization by 2G12. This Ab was also shown to effectively inhibit trans-infection of virus from primary monocyte-derived dendritic cells (MDDCs) to CD4+ T-cells. Attachment of Fc-gp120 to MDDCs and PBLs was partially inhibited by 2G12, while b12 and sCD4 did not inhibit binding to MDDCs but did inhibit binding to PBLs. The results indicate that Env attachment is mediated through DC-SIGN and other receptors on MDDCs while it is predominantly mediated by CD4 and CCR5 on PBLs. Binley *et al.* [2006] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**, **binding affinity**, **dendritic cells**)
- 2G12: Development of neutralizing Abs and changes to Env gp120 were analyzed in SHIV infected macaques during a period of 1 year. 4 macaques showed little viral divergence while the remaining 7 showed significant env divergence from the inoculum, associated with higher titers of homologous NAbs. In five of the 7 divergent animals, the glycosylation site N386, which is a part of the 2G12 epitope, was significantly added. Glycosylation sites N392, on the inner domain of gp120, and N295, on the silent face, also forma a part of the 2G12 epitope, and were found to be highly conserved. Blay *et al.* [2006] (**antibody binding site definition and exposure**)
- 2G12: Inhibition of 2G12 binding to gp120 by 2G12-like Abs in sera from long-term non-progressors (LTNP) was determined. 2G12-like Abs were present in almost all sera from LTNPs but at a lower levels than b12. Higher 2G12-like Ab levles were significantly associated with the broadest neutralizing activity in sera from LNTPs. Braibant *et al.* [2006] (**enhancing activity**, **neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2G12: Cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors either with or without broadly cross-reactive neutralizing antibodies were shown to be of comparable susceptibility to neutralization by 2G12. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2G12: Neutralization rates and rate constants for the neutralization of clade B primary isolates SF33, SF162 and 89.6 by this Ab were determined. Statistically significant neutralization was not observed for isolate SF162. It was shown that neutralization sensitivity is not associated with neutralization of cell-associated or free virus. Davis *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **kinetics**)
- 2G12: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). 2G12 recognized all four gp140 proteins equally. Low titers of Abs capable of blocking the binding of 2G12 were present in the sera from the SHIV-infected macaque, but were absent in the sera from the gp140-immunized animals. Derby *et al.* [2006] (**antibody binding site definition and exposure**)
- 2G12: Env-pseudotyped viruses were constructed from the gp160 envelope genes from seven children infected with subtype C HIV-1. 2G12 failed to neutralize any of the seven viruses, correlating with the absence of crucial N-linked glycans that define 2G12 epitope on these viruses. When this Ab was mixed with IgG1b12 and 2F5, the neutralization was similar as to IgGb12 alone, indicating that the majority of the pool activity was due to IgG1b12. When 4E10 was added to this mix, all isolates were neutralized. Gray *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **responses in children**, **mother-to-infant transmission**)
- 2G12: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **escape**)

B Cell

- 2G12: Viruses with cleavage-competent 2G12-knockout Env and cleavage-defective Env able to bind 2G12 were constructed. The amount of Env precipitated by 2G12 was same when the two pseudotyped virus variants were mixed as with the wildtype alone, suggesting formation of heterotrimers consisting of both cleavage-competent and defective Envs. The presence of nonfunctional Envs on the surface of infectious virions did not affect the neutralization by 2G12. The neutralization by the CD4-binding agents was also unaffected by 2G12 binding to uncleaved Env indicating that the function of a trimer is unaffected sterically by the binding of an antibody to adjacent trimer. Herrera *et al.* [2006] (**neutralization**, **binding affinity**)
- 2G12: Inhibition of R5 HIV replication by monoclonal and polyclonal IgGs and IgAs in iMDDCs was evaluated. The neutralizing activity of 2G12 was higher in iMDDCs than in PHA-stimulated PBMCs. A 90% reduction of HIV infection was observed without induction of MDDC maturation by this mAb. Blockade of FcgammaRII on iMDDCs decreased the anti-HIV acitvity of 2G12 while increased expression of FcgammaRI increased inhibition of HIV by 2G12, suggesting the involvment of these receptors in the HIV-inhibitory activity of this Ab. Holl *et al.* [2006b] (**neutralization**, **dendritic cells**)
- 2G12: The ability of this Ab to inhibit viral growth was increased when macrophages and immature dendritic cells (iDCs) were used as target cells instead of PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs can occur by two distinct mechanisms, neutralization of infectivity involving only the Fab part of the IgG, and, an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 2G12: Pharmacokinetic properties of this Ab were studied in HIV infected patients infused with high doses of 2G12. The Ab did not elicit an endogenous immune response and had distribution and systemic clearance values similar to other Abs. The elimination half-life was measured to 21.8 days, which is significantly longer than the elimination half-life of 4E10 and 2F5. Joos *et al.* [2006] (**kinetics**, **immunotherapy**)
- 2G12: This Ab was used as a control since its epitope is independent of either V1/V2 or V3 domains confirmed in its equal neutralization of SF162 and variants SF162(JR-FL V3), SF162(JR-FL V1/V2) and SF162(JR-FL V1/V2/V3). This Ab was also shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, H, C, CRF02_AG and CRF01_AE). Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2G12: All subtype C env-pseudotyped clones derived from individuals in acute/early stage of HIV-1 infection were highly resistant to neutralization by this Ab, since each of the clones lacked a PNLG at one or more critical epitope positions. The sensitivity of clones to a mix of Abs IgG1b12, 2G12 and 2F5 was tracked to IgG1b12. Li *et al.* [2006c] (**neutralization**, **variant cross-recognition or cross-neutralization**, **acute/early infection**, **subtype comparisons**)
- 2G12: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. 2G12 was shown to bind specifically to all recombinant proteins except for the subtype B gp140δCF and subtype A gp140δCFI. The specific binding of this Ab to CON-S indicated that its conformational epitope was intact. This Ab also bound specifically to the two tested subtype B gp120 proteins. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- 2G12: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. 2G12 effectively neutralized wildype virus particles. 2G12 was found to bind to both nonfunctional monomers and to gp120-gp41 trimers. Binding of 2G12 to trimers correlated with its neutralization of wildtype virus particles. Monomer binding did not correlate with neutralization, but it did correlate with virus capture. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2G12: SHIV SF162p4 virus used as challenge in ISCOM vaccinated macaques was shown to be highly sensitive to neutralization by this Ab. Pahar *et al.* [2006] (**neutralization**)
- 2G12: A carbohydrate mimetic peptide with central motif versions RYRY and YPYRY was shown to precipitate human IgG Ab that bind to gp120 and to immunoprecipitate gp120 from transfected cells. 2G12 showed significant binding only to the PYPY motif version of the peptide. Pashov *et al.* [2006] (**mimotopes**)
- 2G12: Binding of 2G12 to wt gp120 and two constructs with 5 and 9 residues deleted in the middle of the beta3-beta5 loop in the C2 region of gp120 was examined. The deletions of the loop residues did not affect the conformation of 2G12 epitope as 2G12 Ab binding and kinetics were identical for the wt gp120 and both constructs. Rits-Volloch *et al.* [2006] (**antibody binding site definition and exposure**, **kinetics**, **binding affinity**)
- 2G12: A fusion protein (FLSC R/T-IgG1) that targets CCR5 was expressed from a synthetic gene linking a single chain gp120-CD4 complex containing an R5 gp120 sequence with the hinge-Ch2-Ch3 portion of human IgG1. The fusion protein did not activate the co-receptor by binding. In cell-line based assays, the FLSC R/T-IgG1 was less potent in neutralizing R5 HIV-1 primary isolates than 2G12, while in PBMC assays they were comparable. Vu *et al.* [2006] (**neutralization**)
- 2G12: This Ab was used as a positive control in the neutralization assay. At the highest Ab concentrations, 2G12 was able to neutralize several primary isolates but not all, with a neutralization pattern similar to that of rabbit sera immunized with monovalent and polyvalent DNA-prime/protein-boost Env from different HIV-1 subtypes. At a reduced concentrations, 2G12 showed much weaker neutralizing activities. Wang *et al.* [2006a] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

B Cell

- 2G12: Viruses with wild-type HIV-1JR-FL Envs were neutralized by this Ab at much lower concentrations than HIV-1 YU2 Env viruses. Yang *et al.* [2006] (**neutralization**, **binding affinity**)
- 2G12: No significant levels of 2G12 were shown to bind to HA/gp41 expressed on cell surfaces and this Ab did not stain cells expressing HA/gp41 in a fluorescence assay. However, it did bind to HIV 89.6 Env expressing cells. Ye *et al.* [2006] (**antibody binding site definition and exposure**, **binding affinity**)
- 2G12: Interactions of this Ab with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that 2G12 interactions with the soluble monomers and trimers were minimally affected by GA cross-linking of the proteins, indicating that the 2G12 epitope was maintained after cross-linking. This Ab was associated with a small entropy change upon gp120 binding. This Ab was shown to have a kinetic advantage as it bound to gp120 faster than other less neutralizing Abs. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**, **binding affinity**)
- 2G12: The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. Chimeric Env-pseudotyped virus Ch5, containing all three of the mutations, was equally neutralization sensitive to 2G12 as Ch2, which did not contain any of these mutations. Beddows *et al.* [2005b] (**neutralization**)
- 2G12: A panel of 60 HIV-1 isolates, with complete genome sequences available, was formed for neutralization assay standardization. It comprises of 10 isolates from each of the subtypes A, B, C, D, CRF01_AE and CRF02AG, with majority of the viruses being of R5 phenotype and few of X4 phenotype. Neutralization profile of each isolate was assessed by measuring neutralization by sCD4, a cocktail of MAbs including 2G12, 2F5 and IgG1b12, and a large pool of sera collected from HIV-1 positive patients. The MAb cocktail neutralized with >50% a large portion of the isolates (51/60) including: 10 subtype A isolates, 8 subtype B isolates, 8 subtype C isolates, 9 subtype D isolates, 7 CRF-01_AE isolates, and 9 CRF_02AG isolates. Brown *et al.* [2005] (**neutralization**, **subtype comparisons**, **assay standardization/improvement**)
- 2G12: Four primary isolates (PIs), Bx08, Bx17, 11105C and Kon, were tested for binding and neutralization by 2G12. 2G12 was only able to neutralize Bx08, but bound well to both Bx08 and Bx17 and less well to 11105C and Kon. There was no direct correlation between binding and neutralization of the four PIs by 2G12. CD4-induced gp120 shedding resulted in a decrease of 2G12 binding to Bx08. Presence of gp160 depleted of the principal immunodominant domain (PID) significantly decreased capture of Bx17 and Kon by 2G12. Presence of both gp160ΔPID and PID slightly improved the inhibition of virus capture compared to PID peptide alone, revealing an additive effect. Burrer *et al.* [2005] (**neutralization**, **binding affinity**)
- 2G12: The unique structure of the 2G12 MAb, and the reasons for its unique ability to recognize oligomannose chains on the silent face of the gp120, are reviewed. Engineering of Abs based on revealed structures of broadly neutralizing MAbs is discussed. Burton *et al.* [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 2G12: Precise characterization of 2G12 binding to carbohydrate was undertaken; the 2G12 Fab was co-crystallized with four oligomannose derivatives, Man4, Man5, Man7 and Man8. 2G12 recognizes the terminal Manα1-2Man both in the context of the D1 arm (Manα1-2Manα1-2Man) and D3 arm (Manα1-2Manα1-6Man) of the Man9GlcNAc2 moiety, but not the D2 arm. This gives the 2G12 more binding flexibility than previously thought, as only the D1 arm binding had been shown previously. Calarese *et al.* [2005] (**antibody binding site definition and exposure**, **structure**)
- 2G12: The lack of glycosylation sites at residues Asn 295 and Thy 394 within C-clade gp120s generally causes the loss of 2G12 recognition. Introduction of glycans in the subtype C strain HIV-1CN54 at these positions restored 2G12 binding, and addition of just a single glycan partially restored binding (V295N + A394T » V295N > A395T). 2G12 epitope recovery decreased b12 binding. Chen *et al.* [2005] (**antibody binding site definition and exposure**)
- 2G12: 2G12 was investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. The activity of 2G12 was induced in the post-CD4 format and was less pronounced in the standard format. 2G12 did not neutralize after CD4/CCR5 engagement. HIV-1 + human plasma mediated high-levels of post-CD4 neutralization indicating presence of b12 and 2G12 -like Abs. Crooks *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **assay standardization/improvement**)
- 2G12: SFV-gp140(-GCN4) was constructed for analysis of its immunogenic properties in animal models. Both gp120 and gp140(-GCN4) secreted from rSFV-infected cells were recognized by 2G12, suggesting that the proteins retained their native folding. Forsell *et al.* [2005] (**antibody binding site definition and exposure**)
- 2G12: Monomeric gp120 and trimeric gp140CF proteins synthesized from an artificial group M consensus Env gene (CON6) bound efficiently to 2G12, indicating correct exposure of the 2G12 epitope. A mix of 2G12, 2F5 and b12 MAbs (TriMab2) was used for neutralization assessment of some subtype B isolates, but showed no significant neutralization. Gao *et al.* [2005a] (**antibody binding site definition and exposure**, **neutralization**)
- 2G12: 2909 is a human anti-Env NAb that was selected by a neutralization assay and binds to the quaternary structure on the intact virion. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670, 1418, nor 2G12; in fact, 2G12 enhanced 2909 binding. Gorny *et al.* [2005]
- 2G12: 2G12 neutralized viral isolates HXBc2, SF162, 89.6 and BaL. ADA isolate was poorly neutralized and the YU2 isolate was not neutralized. Neutralization was concentration dependent, as higher MAb concentration resulted in higher %

B Cell

of neutralization. The exception was the YU2 isolate, where higher concentration of 2G12 resulted in enhancement of viral infection. Grundner *et al.* [2005] (**enhancing activity**, **neutralization**)

- 2G12: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. Unlike the other three broadly neutralizing human anti-HIV-1 MAbs, 2G12 has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 2G12: This review summarizes data on the polyspecific reactivities to host antigens by the broadly neutralizing MAbs IgG1b12, 2G12, 2F5 and 4E10. It also hypothesizes that some broadly reactive Abs might not be routinely made because they are derived from B cell populations that frequently make polyspecific Abs and are thus subjected to B cell negative selection. Haynes *et al.* [2005b] (**antibody generation**, **antibody interactions**, **review**)
- 2G12: 2G12 bound with a higher maximal mean fluorescence intensity (MFI) to Env protein on the surface of cells producing gp140Δct-pseudotyped neutralization resistant 3.2P strain, than to the Env of pseudotyped neutralization sensitive HXBc2. Neutralization assays with the pseudotyped viruses showed that 2G12 neutralized both viruses with same potency. Furin co-transfection did not have an effect on the reactivity of pseudoviruses with 2G12 or on their neutralization sensitivity. Presence or absence of sialic acid residues did not affect Env reactivity with 2G12. Herrera *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2G12: Why broadly neutralizing Abs, such as 2G12, 2F5 and 4E10, are extremely rare, and their protective abilities and potential role in immunotherapy are discussed. Jülg & Goebel [2005] (**neutralization**, **immunotherapy**, **review**)
- 2G12: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in increased relative neutralization resistance of the LLP-2 mutant virus to 2G12, compared with wildtype virus. The increased neutralization resistance of LLP-2 virus was associated with decreased 2G12 binding to its epitope. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2G12: A series of genetically modified Env proteins were generated and expressed in both insect and animal cells to be monitored for their antigenic characteristics. For 2G12, two of the modified proteins expressed in insect cells, dV1V2 mutant (V1V2 deletions) followed by the dV2 mutant, showed higher binding to the Ab than the wildtype Env did, indicating that V1V2 deletion exposes epitopes against 2G12 better than other proteins. Unlike for most of the other MAbs, 3G mutant (mutations in 3 glycosylation sites) did not show a higher binding affinity to 2G12. When expressed in animal cells, only dV2 mutant resulted in higher binding to 2G12, while all other modified proteins showed lower binding compared to the wildtype. Kang *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 2G12: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B V3s. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. Neutralization by Cameroonian sera MAbs was blocked by Clade A and B V3 loop fusion proteins, while NAbs to non-V3 epitopes, 2F5, 2G12, and b12, were not blocked. Krachmarov *et al.* [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2G12: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. 12 out of 19 pseudoviruses were neutralized by 2G12, as were SF162.LS and IIIB strains but not the MN strain. Resistance to 2G12 was generally associated with lack of N-glycosylation sites, except in one case, where the clone was resistant to neutralization in spite of presence N-glycosylation sites. Two clones lacked N-glycosylation at residues 339 and 386, but remained sensitive to 2G12. A mixture of IgG1b12, 2F5 and 2G12 (TriMab) exhibited potent neutralizing activity against all Env-pseudotyped viruses except one. 7 out of 12 Env-pseudotyped viruses were more sensitive to neutralization by 2G12 than their uncloned parental PBMC-grown viruses. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 2G12: Pseudoviruses expressing HIV-1 envelope glycoproteins from BL01, BR07 and 89.6 strains were compared in neutralization assays to replication competent clone derived from transfection of 293T cells (IMC-293T) and to the IMC-293T derived from a single passage through PBMC (IMC-PBMC). The neutralization responses of pseudoviruses and corresponding IMC-293T to 2G12 were similar, while a significant decrease in viral neutralization sensitivity to 2G12 was observed for all three IMC-PBMC viruses. The decrease was associated with an increase in average virion envelope glycoprotein content on the PBMC-derved virus. Louder *et al.* [2005] (**neutralization**, **assay standardization/improvement**)
- 2G12: Nine anti-gp41 bivalent Fabs that interacted with either or both of the six-helix bundle and the internal coiled-coil of N-helices of gp41 were selected from a non-immune human phage display library. The IC50 the range for the inhibition of LAV ENV-mediated cell-fusion was 6-61 ug/ml – for context, 2F5 and 2G12 (IC50s of 0.5-1.5 ug/ml) were about an order of magnitude more potent in this assay than the best Fabs generated here. Louis *et al.* [2005] (**neutralization**)
- 2G12: The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication in microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels of CD4 for infection, and increased sensitivity to neutralization by sCD4 and

17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1 Bori and microglia-adapted HIV-1 Bori-15 was assessed in ELISA binding assays using CD4BS MAbs F105 and IgG1b12, glycan-specific 2G12, and V3-specific 447-52D, and were unchanged. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. Martín-García *et al.* [2005] (**antibody binding site definition and exposure**)

- 2G12: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **antibody interactions**, **neutralization**, **vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **immunotherapy**, **review**, **structure**)
- 2G12: Viruses containing substitutions at either L568 or K574 of the gp41 hydrophobic pocket were resistant to D5-IgG1 but were as sensitive to 2G12 as the wildtype virus. Miller *et al.* [2005]
- 2G12: This short review summarizes recent findings of the role of neutralizing Abs in controlling HIV-1 infection. Certain neutralizing MAbs and their potential role in immunotherapy and vaccination, as well as the reasons for their poor immunogenicity, are discussed. Montefiori [2005] (**antibody binding site definition and exposure**, **therapeutic vaccine**, **escape**, **immunotherapy**)
- 2G12: A short review of 2F5 and 4E10 interaction with autoantigens, epitope accessibility, structure, neutralizing capability, and the reasons for their infrequent appearance in nature. Immunotherapy and escape to 2G12 is also discussed. Nabel [2005] (**escape**, **immunotherapy**, **review**)
- 2G12: Passive immunization of 8 HIV-1 infected patients with 4E10, 2F5 and 2G12 (day 0, 4E10; days 7, 14 and 21 4E10+2G12+2F5; virus isolated on days 0 and 77) resulted in 0/8 patients with virus that escaped all three NAbs. Three patients had viruses that escaped 2G12, and two of these were sequenced. Each had lost two of the glycosylation sites required for 2G12 binding (one had 295 N->D and 332 N->T changes, the other had 295 N->T and 392 N->T changes). In a companion in vitro study, resistance to a single MAb emerged in 3-22 weeks, but triple combination resistance was slower and characterized by decreased viral fitness. In contrast to the in vivo escape study, only one N was lost in the in vitro experiments, a 386 N->K change in a triple resistant mutant. The lack of resistance to the combination of MAbs in vivo and the reduced fitness of the escape mutants selected in vitro suggests passive immunotherapy may be of value in HIV infection. Nakowitsch *et al.* [2005] (**escape**, **immunotherapy**)
- 2G12: 2G12 neutralized JR-FL, but not YU2 HIV-1 strain. 2G12 and other neutralizing mAbs recognized JR-FL cleavage-competent and cleavage-defective env glycoproteins, while non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. Pancera & Wyatt [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2G12: Concanavalin A (ConA) binds to mannose and blocks 2G12 binding, but 2G12 does not block ConA binding. ConA binding is less sensitive to mutations in glycosylation sites than 2G12. Furthermore, ConA neutralizes HIV-1 at a post-CD4 binding step. Thus, this report indicates that designing antigens based on the HIV-1 mannose residues that bind ConA may be an effective vaccine strategy, as antibodies elicited might be broadly cross-reactive. Pashov *et al.* [2005b] (**vaccine antigen design**)
- 2G12: 2G12 was used as isolating template for screening of a phage library in order to develop mimotopes that target carbohydrate antigens of gp120. Specific binding of 2G12 to three phages expressing peptides was observed, however, 2G12 did not bind to the peptides themselves. Pashov *et al.* [2005a] (**assay development**)
- 2G12: This study is about the V2 MAb C108g, that is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MABs 4117c, 2219, 2191, and 447-52D, but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 2G12: Virions containing a single point mutation Y706C in gp41 had a 10-fold increase in binding to 2G12 compared to wildtype. This, together with the same p24 supernatant levels after transfection with wildype and mutant virus, indicated that the mutant virions contained more envelope on a per-particle basis. Poon *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 2G12: Retrovirus inactivation for vaccine antigen delivery was explored through lipid modification by hydrophobic photoinduced alkylating probe 1.5 iodonaphthylazide (INA). The viral proteins were shown to be structurally intact in the treated non-infectious virus, through the preservation of antibody binding sites for polyclonal anti-gp120 serum, and for broadly neutralizing MAbs 2G12, b12 and 4E10, although the modifications of the lipid disabled viral infection. Raviv *et al.* [2005] (**vaccine antigen design**)
- 2G12: Escape mutations in HR1 of gp41 that confer resistance to Enfuvirtide reduced infection and fusion efficiency and also delayed fusion kinetics of HIV-1. They also conferred increased neutralization sensitivity to a subset of neutralizing MAbs that target fusion intermediates or with epitopes exposed following receptor interactions. Enhanced neutralization correlated with reduced fusion kinetics. None of the mutations had a significant effect on 2G12 neutralization

B Cell

of virus. Reeves *et al.* [2005] (**antibody binding site definition and exposure**, **drug resistance**, **neutralization**, **escape**, **HAART, ART**)

- 2G12: There was no difference found in the neutralization sensitivity of viruses isolated from acutely and from chronically infected HIV-1 patients to this Ab, suggesting that the glycosylation sites manifesting the epitope of 2G12 are well conserved throughout the course of infection. Rusert *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **acute/early infection**)
- 2G12: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. 2G12 had diminished binding to both antigen constructs. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 2G12: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **binding affinity**, **immunotherapy**, **review**, **structure**)
- 2G12: Six acutely and eight chronically infected patients were passively immunized with a mix of 2G12, 2F5 and 4E10 neutralizing Abs during treatment interruption. Two chronically and four acutely infected individuals showed evidence of a delay in viral rebound during Ab treatment suggesting that NAbs can contain viremia in HIV-1 infected individuals. All subjects with virus sensitive to 2G12 developed Ab escape mutants resulting in loss of viremia and failure to treatment. In several cases resistance to 2G12 emerged rapidly. Plasma levels of 2G12 were substantially higher than those of 2F5 and 4E10, and the 2G12 levels exceeded the in vitro required 90% inhibitory doses by two orders of magnitude in subjects that responded to Ab treatment. This suggested that high levels of NAbs are required for inhibition in vivo. Trkola *et al.* [2005] (**neutralization**, **acute/early infection**, **escape**, **immunotherapy**, **early treatment**, **HAART, ART**, **supervised treatment interruptions (STI)**)
- 2G12: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- 2G12: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds had little effect on binding of the 2G12 to the glycoprotein, indicating that the inter-S-S bonds had no impact on the exposure of 2G12 epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- 2G12: This review summarizes data that indicate that the V3 region of HIV-1 may be an epitope to target for the induction of protective Abs. Data shows that the V3 region can induce broadly-reactive, cross-neutralizing Abs, that it is partially exposed during various stages of the infectious process, and that it is immunogenic. 2G12 is the only highly neutralizing MAb targeting the carbohydrate region of gp120, suggesting that this region does not induce protective Abs. The carbohydrate epitope is poorly immunogenic and 2G12 has an aberrant structure probably extremely rare in the human Ab repertoire. Zolla-Pazner [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **review**)
- 2G12: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. 2G12 primarily neutralized B clade viruses with sporadic neutralization of A, D, and two AC recombinants, and no C or CRF01 (E) isolates. Envelopes from subtypes C and E have generally lost critical glycans for 2G12 binding. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2G12: The peptide 12p1 (RINNIPWSEAMM) inhibits direct binding of YU2 gp120 or Env trimer to CD4, CCR5 and MAb 17b in a concentration-dependent allosteric manner. 12p1 is thought to bind to unbound gp120 near the CD4 binding site, with a 1:1 stoichiometry. 12p1 also inhibited MAb F105 binding. presumably because F105 favors an unactivated conformation, but not MAbs 2G12 or b12. The 1:1 stoichiomtry, the fact that the peptide binding site is accessible on the trimer, the non-CD4 like aspect of the binding, and an ability to inhibit viral infection in cell cultures make it a promising lead for therapeutic design. Biorn *et al.* [2004]
- 2G12: Env sequences were derived from 4 men at primary infection and four years later; the antigenicity in terms of the ability to bind to 2G12, 2F5 and IgG1b12 was determined. 2G12 bound primarily to late clones in 3 of the 4 patients, and to both early and late in the other patient. Neither 2F5 nor IgG1b12 showed a difference in binding affinity to early or late envelopes. The number of glycosylation sites increased in the three patients. The ability to bind to 2G12 correlated perfectly with having all three sites known to be important for binding: N295 in C2, N332 in C3, and N392 in the V4 loop. Dacheux *et al.* [2004] (**antibody binding site definition and exposure**, **acute/early infection**, **kinetics**)
- 2G12: Neonatal rhesus macaques were exposed orally to a pathogenic SHIV, 89.6P. 4/8 were given an intramuscular, passive immunization consisting of NAbs 2G12, 2F5 and 4E10, each given at a different body sites at 40 mg/kg per Ab, at one hour and again at 8 days after exposure to 89.6P. The four animals that were untreated all died with a mean survival time of 5.5 weeks, the four animals that got the NAb combination

B Cell

were protected from infection. This model suggests Abs may be protective against mother-to-infant transmission of HIV. Ferrantelli *et al.* [2004b] (**mother-to-infant transmission**)

- 2G12: Nabs against HIV-1 M group isolates were tested for their ability to neutralize 6 randomly selected HIV-1 O group strains. 2G12 didn't neutralizeO group strains, although it was included in a quadruple combination of b12, 2F5, 2G12, and 4E10, that neutralized the six Group O viruses between 62-97%. Ferrantelli *et al.* [2004a] (**variant cross-recognition or cross-neutralization**)
- 2G12: This paper is a reviw of anti-HIV-1 Envelope antibodies. This unique epitope is formed from carbohydrates. The mechanism of MAb neutralization is thought to be steric inhibition of CCR5 binding. 2G12 neutralizes many TCLA strains and about 40% of primary isolates tested. Gorny & Zolla-Pazner [2004] (**review**)
- 2G12: A set of oligomeric envelope proteins were made from six primary isolates for potenial use as vaccine antigens: 92/UG/037 (clade A), HAN2/2 (clade B), 92/BR25/025 (clade C), 92/UG/021 (clade D), 93/BR/029 (clade F) and MVP5180 (clade O). This was one of a panel of MAbs used to explore folding and exposure of well characterized epitopes. The clade C isolate BR25 is apparently misfolded, as conformation-dependent antibodies did not bind to it. 2G12 bound to clade A, B, D and F HIV-1 primary isolates. Polyclonal sera raised in rabbits against these antigens cross-bound the other antigens, but none of the sera had neutralizing activity. Jeffs *et al.* [2004] (**vaccine antigen design**, **subtype comparisons**)
- 2G12: 2G12 was used as a positive control in a study that showed that A32-rgp120 complexes open up the CCR5 co-receptor binding site, but did not induce neutralizing antibodies with greater breadth among B subtype isolates than did uncomplexed rgp120 in vaccinated guinea pigs. Liao *et al.* [2004] (**vaccine antigen design**)
- 2G12: Mice susceptible to MV infection were intraperitoneally immunized with native HIV-1 89.6 env gp160 and gp140 and δV3 HIV-1 89.6 mutants expressed in live attenuated Schwarz measles vector (MV). The gp160ΔV3 construct raised more cross-reactive NAbs to primary isolates. A HIVIG/2F5/2G12 combination was used as a positive control and could neutralize all isolates. Lorin *et al.* [2004] (**vaccine antigen design**)
- 2G12: A set of HIV-1 chimeras that altered V3 net charge and glycosylation patterns in V1V2 and V3, involving inserting V1V2 loops from a late stage primary isolate taken after the R5 to X4 switch, were studied with regard to phenotype, co-receptor usage, and MAb neutralization. The loops were cloned into a HXB2 envelope with a LAI viral backbone. It was observed that the addition of the late-stage isolate V1V2 region and the loss of V3-linked glycosylation site in the context of high positive charge gave an X4 phenotype. R5X4 viruses were more sCD4 and 2G12 neutralization resistant than either R5 or X4, but the opposite pattern was observed for b12. Addition of the late stage V1V2 altered neutralization for both MAbs, but this alteration was reversed with the loss of the V3 glycan. Nabatov *et al.* [2004] (**antibody binding site definition and exposure**, **co-receptor**)
- 2G12: An antigen panel representing different regions of gp41 was generated, and sera from 23 individuals were screened. 2G12 was a control, binding to gp120 but to none of the gp41 peptides in the experiment. Opalka *et al.* [2004] (**assay development**, **assay standardization/improvement**)
- 2G12: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it binds to the neutralizing MAb 2G12. It masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 2G12: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 2G12 was the only MAb that neutralized JRFL more efficiently than SF162, with a 6-fold lower ND50 for JRFL. 2G12 also had ahigher affinity for JRFL. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 2G12: A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CC-con19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. The IC50 for 2G12 was 1.8 for CC1/85, and was 4.2 for CC-con19, so both the primary and passaged viruses were neutralized. Pugach *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **viral fitness and reversion**)
- 2G12: This review discusses research presented at the Ghent Workshop of prevention of breast milk transmission and immunoprophylaxis for HIV-1 in pediatrics (Seattle, Oct. 2002), and makes the case for developing passive or active immunoprophylaxis in neonates to prevent mother-to-infant transmission. Macaque studies have shown that passive transfer of NAb combinations (for example, IgG1b12, 2G12, 2F5, and 4E10; or 2G12 and 2F5) can confer partial or complete protection to infant macaques from subsequent oral SHIV challenge. Safrit *et al.* [2004] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: Synthetic mannose Man9 clusters arranged on a scaffold were used to mimic the epitope of 2G12. Bi-, tri, and tetra-valent clusters had a 7-, 22-, and 73-fold higher affinities for 2G12 than the monomers, suggesting that 2G12 binds best to multiple carbohydrate moieties. 2G12 bound larger mannose oligosaccharides with higher affinity: Ma9GlcNAc bound 210- and 74-fold more effectively that Man6GlcNac

B Cell

and Man5GlcNAc, respectively. Wang *et al.* [2004] (**antibody binding site definition and exposure**)

- 2G12: SOS-Env is a mutant protein engineered to have a disulfid bond between gp120 and gp41. Cells expressing SOS-Env due not fuse with target cells expressing CD4 and CCR5, although the fusion process proceeds to an intermediate state associated with CD4 and co-receptors, prior to the formation of the six helix bundle that allows fusion.2G12 was used to monitor surface expression of SOS-Env compared to wildtype. Abrahamyan *et al.* [2003] (**co-receptor**, **vaccine antigen design**)
- 2G12: 2G12 was used as a positive control to test for a NAb activity in mice intranasally immunized with gp120 or gp140 with IL-12 and Cholera Toxin B. Albu *et al.* [2003]
- 2G12: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. 2G12 is able to neutralize both the wildtype and SOS protein comparably, but 2G12 could not neutralize SOS when added post-attachment. Binley *et al.* [2003] (**vaccine antigen design**)
- 2G12: Crystal structure analysis of Fab 2G12 alone or complexed with Manα1-2Man or Man9GlcNac2 demonstrates that the exchange of VH domains forms stable dimers for gp120 binding. Two Fabs assemble in an interlocked VH domain swapped dimer, providing an extended surface for multivalent interaction with the cluster of oligomannose on gp120, allowing high-affinity recognition of repeated epitopes in the carbohydrate structure. Ala substitutions of the 2G12 VH/VH' interface residues Ile H19, Arg H57, Phe H77, Tyr H80, Val H84 and Pro H113 result in the loss of 2G12-gp120 JR-FL binding. Calarese *et al.* [2003] (**antibody binding site definition and exposure**, **antibody sequence variable domain**, **structure**)
- 2G12:The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 and 2G12 enhanced each others binding, and gave synergistic neutralization. B4e8 could neutralize R5X4 virus 92HT593 better than 2G12, while 2G12 was better at neutralizing R5 virus 92US660. Cavacini *et al.* [2003] (**antibody interactions**)
- 2G12: 2G12 was used as a negative control to investigate the relationship of MAb 412d epitope to the CCR5 binding site of gp120. These two MAbs were incubated with soluble CD4 and ADA gp120 in the presence of a peptide shown to block the association of gp120-CD4 with CCR5. As expected, the presence of the peptide did not inhibit precipitation of gp120 by 2G12, since it binds an epitope distinct from the CCR5 binding domain, while it did inhibit the 412d. Choe *et al.* [2003] (**antibody binding site definition and exposure**)
- 2G12: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. Dey *et al.* [2003] (**co-receptor**)
- 2G12: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. Ferrantelli *et al.* [2003] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: This study investigates the effects of glycosylation inhibitors on the binding between HIV-1 gp120 and mannose-binding lectin (MBL). Mannosidase I inhibitor deoxymannojirimycin (dMM) inhibits formation of complex and hybrid N-linked saccharides and yields virus with more mannose residues. dMM added during viral production significantly enhanced the binding 2F5 and 2G12, but not IgG1b12 in a viral capture assay. Hart *et al.* [2003] (**antibody binding site definition and exposure**)
- 2G12: CD4BS MAbs b12 (neutralizing) and 205-42-15, 204-43-1, 205-46-9 (non-neutralizing) all cross-competed for binding to monomeric gp120, indicating the topological proximity of their epitopes, however, the non-neutralizing CD4BS MAbs did not interfere with the neutralization activity of MAb b12 – 2G12 was used to normalize and as a control in these experiments. Herrera *et al.* [2003] (**antibody interactions**)
- 2G12: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. Kitabwalla *et al.* [2003] (**antibody interactions**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **mother-to-infant transmission**, **subtype comparisons**)
- 2G12: Polyclonal Abs raised against soluble trivalently linked N35CCG-N13 and N34CCG, the internal trimeric core of the coiled-coil ectodomain, inhibit HIV-1 Env-mediated cell fusion at levels comparable to 2G12. Louis *et al.* [2003] (**vaccine antigen design**)
- 2G12: This review dicusses the importance and function of protective antibody responses in animal model studies in the context of effective vaccine development. SHIV models have shown protection using high levels of MAbs can prevent infection, and partial protection that can influence disease course can be obtained from modest levels of NAbs. SHIV challenges studies conducted with infusions of combinations of MAbs b12, 2G12, and 2F5 are reviewed. Mascola [2003] (**immunoprophylaxis**, **review**)
- 2G12: Infusions of 2F5 and 2G12 intravenously administered 24h prior to vaginal SHIV-89.P challenge are able to protect macaques from infections. Animals that recieve a IL-2 adjuvanted DNA immunization SIV Gag and HIV Env have T-cell responses and lower viral loads, but were not protected. Suboptimal levels of 2F5 and 2G12 were not able to confer sterile

protection in combination with the T-cell responses stimulated by DNA immunizations. Mascola *et al.* [2003]

- 2G12: AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessation of therapy, which then declined to a low level. The polyclonal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. Montefiori *et al.* [2003] (**acute/early infection**, **escape**)
- 2G12: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. 2G12 was the only MAb tested to recognize all blood and brain isolates from all four patients by gp120 immunoprecipitation. Ohagen *et al.* [2003] (**variant cross-recognition or cross-neutralization**)
- 2G12: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded. Pantophlet *et al.* [2003a] (**antibody binding site definition and exposure**)
- 2G12: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 2G12: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs IgG1b12, F91 and F105 and their Fab counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. The carbohydrated binding MAb 2G12 also inhibited CD4-independent syncytium formation. Raja *et al.* [2003] (**co-receptor**)
- 2G12: Most plasma samples of patients from early infection had NAb responses to early autologous viruses, and NAbs against heterologous strains tended to be delayed. Serial plasma samples were tested against serial isolates, and neutralization escape was shown to be rapid and continuous throughout infection. Autologous neutralization-susceptible and resistant viruses from four patients were tested for susceptability to neutralizing Ab responses using MAbs 2G12, IgG1b12 and 2F5. No correlation was established, all viruses tested were susceptible to at least one of the neutralizing MAbs. Two patients that did not have an autologous NAb response also did not evolve changes in susceptibility to these MAbs, while one patient with a pattern of autologous neutralization and escape acquired a 2G12 sensitive virus at month 6, and lost IgG1b12 sensitivity at month 21. Richman *et al.* [2003] (**autologous responses**, **acute/early infection**, **escape**)
- 2G12: To begin to design vaccine antigens that can mimic the carbohydrate structure, the gp120 peptide 336-342 was synthesized with Man(9), Man(6), and Man(5) moieties attached. Singh *et al.* [2003] (**vaccine antigen design**)
- 2G12: Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. They have shown that both N-glycans, at 295N and 332N are required for 2G12 binding, emphasizing the oligosaccharide cluster nature of the epitope, and suggest the uniqueness of the target structure may not result in autoimmune reactions. Wang [2003] (**vaccine antigen design**, **review**)
- 2G12: The broadly neutralizing antibodies 2F5 and 2G12 were class-switched from IgG to IgA and IgM isotypes. Neutralizing potency was increased with valence for 2G12 so the IgM form was most potent, but for 2F5 the IgG form was most potent. Eight primary isolates were tested including two subtype A isolates. The polymeric IgM and IgA Abs, but not the corresponding IgGs, could interfere with HIV-1 entry across a mucosal epithelial layer, although they were limited in a standard neutralization assay. All isotypes could interact with activated human sera, presumably through complement, to inhibit HIV replication. Wolbank *et al.* [2003] (**complement**, **isotype switch**, **variant cross-recognition or cross-neutralization**, **mucosal immunity**, **subtype comparisons**)
- 2G12: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. 2G12 had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- 2G12: A phase I trial in seven HIV+ individuals was conducted with MAbs 2F5 and 2G12 – no clinical or laboratory abnormalities were observed throughout the study – eight infusions were administered over a 4-week period (total dose 14 g) – the elimination half-life ($t_{1/2}$) was calculated to be 7.94 (range, 3.46–8.31) days for 2F5 and 16.48 (range, 12.84–24.85) days for 2G12. Armbruster *et al.* [2002] (**kinetics**, **immunotherapy**)
- 2G12: IgG1b12 neutralized many South African (5/8) and Malawian (4/8) clade C primary HIV-1 isolates, being more effective than 2F5 which neutralized only two Malawian and no South African isolates. 2G12 did not neutralize any of the 16 isolates. Bures *et al.* [2002] (**subtype comparisons**)
- 2G12: This study examined Ab interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4

B Cell

isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 did not affect binding of 2G12 to either R5X4 and R5 isolates, and anti-V3 MAb B4a1 increased 2G12 binding to R5X4 virions but not R5. Neutralization with B4al and 2G12 was additive for the R5X4 virus, and was enhanced for the R5 virus. Cavacini *et al.* [2002] (**antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)

- 2G12: A modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. Chakrabarti *et al.* [2002] (**vaccine antigen design**)
- 2G12: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**antibody binding site definition and exposure**)
- 2G12: Review of NAbs that notes 2G12 alone or in combination with other MAbs can protect some macaques against SHIV infection, that it has strong ADCC activity, and that it is safe and well tolerated in humans. Ferrantelli & Ruprecht [2002] (**immunoprophylaxis**)
- 2G12: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
- 2G12: UK1-br and MACS2-br are R5 isolates derived from brain tissue samples from AIDS patients with dementia and HIV-1 encephalitis; both are neurotropic, but only UK1-br induced neuronal apoptosis and high levels of syncytium formation in macrophages. UK1-br Env had a greater affinity for CCR5 than MACS-br, and required low levels of CCR5 and CD4 for cell-to-cell fusion and single round infection. PBMC infected with UK1-br and MACS2-br virus isolates were resistant to neutralization by MAb 2G12. UK1-br was more sensitive than MACS2-br to IgG1b12, 2F5 and CD4-IgG2 neutralization. Gorry *et al.* [2002] (**brain/CSF**, **co-receptor**)
- 2G12: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads, while such an affinity difference was not seen with F105 and 2G12 – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface. Grundner *et al.* [2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 2G12: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, except for 2G12, which might not have bound well to the carbohydrate additions on the Drosophila expressed core. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding an ordering of amino acids. 2G12 had an entropy value of -1.6. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- 2G12: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. Liu *et al.* [2002] (**review**)
- 2G12: Rhesus macaques were better protected from vaginal challenge with SHIV89.6D (MAb 2G12, 2/4; MAbs 2F5/2G12, 2/5; and HIVIG/2F5/2G12, 4/5 infected) than from intravenous challenge (MAb 2G12, 0/3; MAbs 2F5/2G12, 1/3; and HIVIG/2F5/2G12, 3/6 infected)– the animals that were infected by vaginal challenge after Ab infusion had low or undetectable viral RNA levels and modest CD4 T-cell decline. Mascola [2002] (**immunoprophylaxis**, **mucosal immunity**)
- 2G12: The 2G12 epitope is composed of carbohydrates involving high-mannose and hybrid glycans of residues 295, 332, and 392, with peripheral glycans from 386 and 448 contributing on either flank, and with little direct gp120 protein surface involvement – these mannose residues are proximal to each other near the chemokine receptor binding surface. Sanders *et al.* [2002] (**antibody binding site definition and exposure**)
- 2G12: Alanine scanning mutagenesis used in conjunction with competition and replacement studies of N-linked carbohydrates and sugars suggest that the 2G12 epitope is formed from mannose residues contributed by the glycans attached to N295 and N332, with the other N-linked carbohydrates in positions N339, N386, and N392 playing a role in maintaining conformation relevant to 2G12 binding – N295A and N332A mutants showed essentially unchanged anti-CD4BS NAb b12 binding affinities, while N339A, N386A and N392A mutants

B Cell

displayed significantly lowered b12 affinity, presumably due to conformational changes. Scanlan *et al.* [2002] (**antibody binding site definition and exposure**)

- 2G12: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140 – 2G12 complexes with SOS gp140 or with gp120 had a very unusual linear structure. Schulke *et al.* [2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 2G12: The antiviral response to intravenously administered MAbs 2F5 and 2G12 was evaluated in 7 HAART-naïve asymptomatic HIV-1 infected patients during a treatment period of 28 days. MAb therapy reduced plasma HIV RNA in 3/7 patients during the treatment period, and transiently reduced viral load in two more. CD4 counts were up in 3/7 through day 28, and transiently increased in three more. Vigorous complement activation was observed after 48/56 Ab infusions. Virus derived from 2/7 patients could be neutralized by 2G12, and escape from 2G12 was observed in both cases after infusion; one year after the infusion, isolates were again sensitive to 2G12. Stiegler *et al.* [2002] (**complement**, **variant cross-recognition or cross-neutralization**, **escape**, **immunotherapy**)
- 2G12: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. Xu *et al.* [2002] (**antibody interactions**, **immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and MAbs C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002] (**antibody binding site definition and exposure**)
- 2G12: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure**)
- 2G12: SF162DeltaV2 is a virus that has a 30 amino acids deletion in the V2 loop that does not abrogate its infectivity but renders it highly susceptible to neutralization – when incorporated into a codon-optimized DNA vaccine with a CMV promoter and delivered by gene gun, SF162DeltaV2 gave higher neutralizing Ab titers against SF162 than did SF162 itself, and Abs that cross-neutralized non-homologous primary isolates were obtained only when SF162DeltaV2, but not intact SF162, was used as the immunogen – Control MAbs 2F5 and 2G12 could neutralize all of the following primary isolates: 91US056(R5), 92US714(R5), 92US660(R5), 92HT593(R5X4), and BZ167(R5X4), while after the first protein boost, the sera from two SF162DeltaV2 immunized macaques could neutralize 91US056(R5), 92US714(R5), 92US660(R5) and ADA(R5), but not 92HT593(R5X4) or 92US657(R5) – the pattern of cross-recognition shifted after the second boost. Barnett *et al.* [2001] (**vaccine antigen design**)
- 2G12: A combination of MAbs IgG1b12, 2F5, and 2G12 was given postnatally to four neonates macaques that were then challenged with highly pathogenic SHIV89.6P – one of the four infants remained uninfected after oral challenge, two infants had no or a delayed CD4(+) T-cell decline. Hofmann-Lehmann *et al.* [2001] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: Review of studies in macaques that have shown immune control of pathogenic SHIV viremia, improved clinical outcome, and protection, and the implications of the observations for HIV vaccines. Mascola & Nabel [2001] (**review**)
- 2G12: Moore and colleagues review structural aspects of gp120 and how they relate to antigenic domains, and review the data concerning the lack of a clear relationship between genetic subtype and serotype – an exception exists for human MAb 2G12, which does not recognize CRF01 envelopes because of an unusual additional disulfide bond in the V4 loop region that appears to be unique to the subtype E, CRF01 gp120 protein. Moore *et al.* [2001] (**antibody binding site definition and exposure**, **review**)
- 2G12: Structural aspects of the interaction of neutralizing Abs with HIV-1 Env are reviewed – Env essentially has three faces, one is largely inaccessible on the native trimer, and two that exposed but have low immunogenicity on primary viruses – neutralization is suggested to occur by inhibition of the interaction between gp120 and the target cell membrane receptors as a result of steric hindrance and it is noted that the attachment of approximately 70 IgG molecules per virion is required for neutralization, which is equivalent to about one IgG molecule per spike – the 2G12, 17b and b12 epitopes are discussed in detail – although it is potently neutralizing, 2G12 does not interfere with CD4 and coreceptor binding, and this Ab specificity is uncommon in sera from HIV-1-infected individuals. Poignard *et al.* [2001] (**antibody binding site definition and exposure**, **review**)
- 2G12: Chloroquine reduces the HIV-1-infectivity of H9 IIIB cells, apparently through altering the conformation of envelope – there is a reduction of reactivity of 2G12 to its epitope in

B Cell

chloroquine treated cultures. Savarino *et al.* [2001] (**antibody binding site definition and exposure**)

- 2G12: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. Si *et al.* [2001]
- 2G12: A luciferase-reporter gene-expressing T-cell line was developed to facilitate neutralization and drug-sensitivity assays – luciferase and p24 antigen neutralization titer end points were found comparable using NAb from sera from HIV+ donors, and MAbs 2F5, 2G12 and IgG1b12. Spenlehauer *et al.* [2001] (**assay development**)
- 2G12: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**)
- 2G12: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. Xu *et al.* [2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2G12: Neutralizing synergy between MAbs 1b12, 2G12 and 2F5 was studied using surface plasmon resonance to determine the binding kinetics for these three MAbs with respect to monomeric and oligomeric Env protein gp160 IIIB – the 2G12 epitope is highly accessible on both monomeric and oligomeric Envs, 1b12 is highly accessible on monomers but not oligomers, and 2F5 on neither form – binding of 2G12 exposes the 2F5 epitope on gp160 oligomers – 2G12-gp160 oligomer interactions were best fitted to a two state model, with the first complex having a high association constant and fast dissociation, stabilized by conformational changes induced by the binding of a second MAb. Zeder-Lutz *et al.* [2001] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**)
- 2G12: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhancement with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2 – there was no evidence for cooperativity of binding between b12 and 2G12 to envelope spikes expressed on the cell surface of TCLA or primary isolates. Zwick *et al.* [2001c] (**antibody interactions**)
- 2G12: A triple combination of 2F5, F105 and 2G12 effectively neutralized perinatal infection of macaque infants when challenged with SHIV-vpu+ – the mean plasma half-life was 14.0 +/- 7.9 days, the longest of the three Abs. Baba *et al.* [2000] (**immunoprophylaxis**, **mother-to-infant transmission**)
- 2G12: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. Grovit-Ferbas *et al.* [2000] (**vaccine antigen design**)
- 2G12: Because HIV-1 is most often transmitted across mucosal surfaces, the ability of passive transfer of infused HIVIG/2F5/2G12 to protect against mucosal exposure of macaques to pathogenic SHIV 89.6PD was studied – HIVIG/2F5/2G12 protected 4/5 animals against vaginal challenge, 2F5/2G12 combined protected 2/5 animals, and 2G12 alone protected 2/4 animals – in contrast, Mascola and coworkers had previously shown single MAbs could not protect against intervenous challenge – Ab treated animals that got infected through vaginal innoculation had low viral loads and only modest declines in CD4 counts – the infused Abs were detected in the nasal, vaginal, and oral mucosa. Mascola *et al.* [2000] (**immunoprophylaxis**, **mucosal immunity**)
- 2G12: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – 2G12 was an exception and could not neutralize MN in either form. Park *et al.* [2000]
- 2G12: A mini-review of observations of passive administration of IgG NAbs conferring protection against intervenous or vaginal SHIV challenge, that considers why IgG MAbs might protect against mucosal challenge. Robert-Guroff [2000] (**immunoprophylaxis**, **mucosal immunity**, **review**)
- 2G12: A Semliki Forest virus (SFV) expression system carrying BX08 Env was used to study the conformation of gp120 Env – intracytoplasmic gp120 was recognized by the anti-V3 MAbs K24 and F5.5, while gp120 at the plasma membrane was detected only by conformation dependent MAbs 2G12, 670-D and 694/98D and not V3 MAbs – expression in rat brain also showed that surface expressed Env was recognized only by the conformation-dependent Abs and not by anti-V3 Abs. Altmeyer *et al.* [1999]
- 2G12: rgp120 derived from a R5X4 subtype B virus was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – 2G12 was able to bind with low affinity to the rgp120 monomer HIV-1 W61D. Beddows *et al.* [1999]
- 2G12: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by

B Cell

NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**antibody binding site definition and exposure**, **vaccine antigen design**)

- 2G12: Neutralization assays with rsCD4, MAbs, and serum samples from SHIV-infected macaques and HIV-1 infected individuals were used to characterize the antigenic properties of the env glycoprotein of six primary isolate-like or TCLA SHIV variants. 2G12 neutralized the five SHIV strains tested, HXBc2, KU2, 89.6, 89.6P and KB9, in MT-2 cells. Crawford *et al.* [1999] (**variant cross-recognition or cross-neutralization**)
- 2G12: Combinations of HIVIG, 2F5, 2G12 were administered in passive-transfer experiments 24 hours prior to challenge with pathogenic SHIV 89.6PD – 3/6 animals given HIVIG/2F5/2G12 were completely protected, the others had reduced viremia and normal CD4 counts – 1/3 monkeys given 2F5/2G12 showed transient infection, the other two had reduced viral load – all monkeys that received HIVIG, 2F5, or 2G12 alone became infected and developed high-level plasma viremia, although animals that got HIVIG or 2G12 had a less profound CD4 T cell decline. Mascola *et al.* [1999] (**antibody interactions**)
- 2G12: A meeting summary presented results regarding neutralization –MAbs 2G12 and 2F5 tested for their ability to neutralize primary isolate infection of genetically engineered cell lines (cMAGI and others, presented by T. Matthews, A. Trkola, J. Bradac) – an advantage of such cells lines over PBMCs is that markers (X-Gal) can be added for staining to simplify the assay – the consensus of the meeting was that these engineered cell lines did not improve the sensitivity of detection of primary isolate neutralization – D. Burton and J. Mascola presented results concerning passive immunization and protection of hu-PBL-SCID mice and macaques, respectively, and both found combinations of MAbs that were able to achieve 99% neutralization *in vitro* corresponded to efficacy *in vivo*. Montefiori & Evans [1999] (**review**)
- 2G12: Review of the neutralizing Ab response to HIV-1. Parren *et al.* [1999] (**review**)
- 2G12: Hu-PBL-SCID mice were infected with HIV-1s JRCSF and SF162 to study the effect of NAbs on an established infection – no significant differences in the initial rate of decrease in viral load or the plateau levels of viral RNA between the b12 treated and control mice were seen – in most of the Ab treated mice b12 escape mutants were observed with varying patterns of mutations – a combination of b12, 2G12 and 2F5 protected 1/3 mice, and an isolate from one of the other two was resistant to neutralization by all three MAbs. Poignard *et al.* [1999] (**antibody interactions**, **escape**)
- 2G12: Post-exposure prophylaxis was effective when MAb 694/98-D was delivered 15 min post-exposure to HIV-1 LAI in hu-PBL-SCID mice, but declined to 50% if delivered 60 min post-exposure, and similar time constraints have been observed for HIVIG, 2F5 and 2G12, in contrast to MAb BAT123 that could protect when delivered 4 hours post infection. Andrus *et al.* [1998] (**immunoprophylaxis**)
- 2G12: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – MAb 2G12 was the only exception to this, showing reduced binding efficiency. Binley *et al.* [1998] (**antibody binding site definition and exposure**)
- 2G12: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. Connor *et al.* [1998]
- 2G12: Notes that 2G12 and 2F5, potent neutralizing antibodies, were identified by screening for cell surface (oligomeric Envelope) reactivity. Fouts *et al.* [1998] (**antibody binding site definition and exposure**)
- 2G12: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. Frankel *et al.* [1998] (**mucosal immunity**)
- 2G12: The complete V, J and D(H) domain was sequenced – unlike non-neutralizing anti-gp41 MAb 3D6, five neutralizing MAbs (2F5, 2G12, 1B1, 1F7, and 3D5) showed extensive somatic mutations giving evidence of persistent antigenic pressure over long periods – 2G12 D(H) has the best homology to a D(H) segment between D3-22 and D4-23, a region not usually considered for heavy-chain rearrangement because it lacks associated recombination signals in the flanking regions, Kunert *et al.* suggest this may be why Abs that compete with 2G12 are rare. Kunert *et al.* [1998] (**antibody sequence variable domain**)
- 2G12: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS). Li *et al.* [1998] (**antibody interactions**)
- 2G12: Enhances Hx10 binding to CD4 positive or negative HeLa cells, but inhibited binding to CD4+ T-cell line A3.01 – neutralizes Hx10 infection of the HeLa cells. Mondor *et al.* [1998]
- 2G12: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- 2G12: MAbs 2G12, 2F5 and b12 are broadly neutralizing, as are some human polyconal sera, but this paper describes a set of primary isolates that are resistant to all three MAbs and

2 broadly neutralizing sera – results indicate that resistance levels of pediatric isolates might be higher than adult isolates – resistance in general did not seem to be conferred by a loss of binding affinity for gp120 or gp41, rather by a more global perturbation of oligomeric Envelope. Parren *et al.* [1998b] (**variant cross-recognition or cross-neutralization**)

- 2G12: In a study of the influence of the glycan at position 306 of the V3 loop on MAb recognition, 2G12 was found to neutralize an HIV-BRU mutant virus that lacks the V3 loop glycan and has a mutation at the tip of the loop more efficiently than it neutralizes HIV-BRU. Schonning *et al.* [1998] (**antibody binding site definition and exposure**)
- 2G12: Does not compete with binding of MAb generated in response to gp120-CD4 complex, CG10. Sullivan *et al.* [1998b] (**antibody interactions**)
- 2G12: Induces complement-mediated lysis in MN but not primary isolates – primary isolates are refractive to CML. Takefman *et al.* [1998] (**complement**, **variant cross-recognition or cross-neutralization**)
- 2G12: A wide range of neutralizing titers was observed that was independent of co-receptor usage. Trkola *et al.* [1998] (**co-receptor**, **variant cross-recognition or cross-neutralization**)
- 2G12: Summary of the implications of the crystal structure of gp120 combined with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by 2G12 is unknown, but dependent on proper glycosylation and 2G12 is predicted to be oriented toward the target cell when bound, so neutralization may be due to steric hindrance – mutations in positions N 295, T 297, S 334, N 386, N 392 and N 397 HXBc2 (IIIB) decrease 2G12 binding, and the binding region is 25 angstroms from the CD4 binding site – probably the Ab binds in part to carbohydrates, which may account for both its broad reactivity and the scarcity of Abs in the same competition group. Wyatt *et al.* [1998] (**antibody binding site definition and exposure**)
- 2G12: Review of the antigenic and receptor binding-domains of gp120 in relation to the structure of the molecule – MAbs are discussed by category (anti-V2, anti-V3, CD4i, CD4BS...), however as 2G12 binds to a rarely immunogenic region, and it is dependent on glycosylation, it was discussed individually. Wyatt & Sodroski [1998] (**review**)
- 2G12: Review that discusses this MAb – reacts with residues at the base of the V3 loop and V4, and most of the changes that reduce binding are glycosylation sites – it is not clear whether the binding site is peptidic or direct carbohydrate. Burton & Montefiori [1997] (**antibody binding site definition and exposure**, **review**)
- 2G12: In a multilab evaluation of monoclonal antibodies, only IgG1b12, 2G12, and 2F5 could neutralize at least half of the 9 primary test isolates at a concentration of < 25 mug per ml for 90% viral inhibition – neutralized 6 of 9 primary isolates. D'Souza *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 2G12: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 2G12 bound monomer, and weakly bound oligomer and neutralized JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- 2G12: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB Env – 2G12 was a strong neutralizer of SHIV-vpu+ – all Ab combinations tested showed synergistic neutralization – 2G12 has synergistic response with MAbs 694/98-D (anti-V3), 2F5, F105, and b12. Li *et al.* [1997] (**antibody interactions**)
- 2G12: Using concentrations of Abs achievable *in vivo*, the triple combination of 2F5, 2G12 and HIVIG was found to be synergistic to have the greatest breadth and magnitude of response against 15 clade B primary isolates. Mascola *et al.* [1997] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 2G12: A JRCSF variant that was selected for IgG1b12 resistance remained sensitive to MAbs 2G12 and 2F5, for combination therapy. Mo *et al.* [1997] (**escape**)
- 2G12: Review: MAbs 2F5, 2G12 and IgG1b12 have potential for use in combination with CD4-IgG2 as an immunotherapeutic or immunoprophylactic – homologous MAbs to these are rare in humans and vaccine strategies should consider including constructs that may enhance exposure of these MAbs' epitopes. Moore & Trkola [1997] (**immunoprophylaxis**, **immunotherapy**, **review**)
- 2G12: Neutralizes TCLA strains and primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 2G12: Viral binding inhibition by 2G12 was strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5). Ugolini *et al.* [1997] (**antibody binding site definition and exposure**)
- 2G12: Neutralizes primary isolates, HXB2, and chimeric virus with gp120 from primary isolates in an HXB2 background. McKeating *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- 2G12: Binding weakly enhanced by some anti-C1, -C4, -V3, and CD4 binding site MAbs – unusual in that 2G12 binding neither enhanced or inhibited the binding of other MAbs included in the study. Moore & Sodroski [1996] (**antibody interactions**)
- 2G12: Review: exceptional capacity to neutralize primary isolates in terms of both breadth and potency – one of three MAbs (IgG1b12, 2G12, and 2F5) generally accepted as having significant potency against primary isolates. Poignard *et al.* [1996b] (**variant cross-recognition or cross-neutralization**, **review**)
- 2G12: Review: Only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. Sattentau [1996] (**review**)
- 2G12: Conformationally sensitive epitope destroyed by mutations altering the N-linked glycosylation sites near the base of the V3 loop and the amino-terminal flank of the V4 loop. Trkola *et al.* [1996b] (**antibody binding site definition and exposure**)
- 2G12: Neutralizes JR-FL – inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**co-receptor**)

B Cell

- 2G12: Review: binding site is distinct from CD4BS MAbs epitope and is unique among known gp120 MAbs, human or rodent. Moore & Ho [1995] (**review**)
- 2G12: Highly potent Cross-clade neutralizing activity. Trkola *et al.* [1995] (**subtype comparisons**)
- 2G12: Human MAb generated by electrofusion of PBL from HIV-1 + volunteers with CB-F7 cells. Buchacher *et al.* [1994] (**antibody generation**)

Keywords binding affinity, neutralization, subtype comparisons, variant cross-recognition or cross-neutralization

- 3074: To test whether the conformation change of Env induced by CD4 affects the breadth and potency of 3074 neutralization, 3074 was tested in the presence or absence of sCD4 in neutralization of a panel of 12 subtype B and 12 subtype C Env-pseudoviruses. Without sCD4, 3074 neutralized 2 subtype B and 2 subtype C viruses. With sCD4 present, 3074 neutralized 7 subtype B and 5 subtype C viruses, indicating that neutralization resistance of some viruses to 3074 is due to a lack of exposure of the V3 loop. Neutralization of JRFL, ADA, and YU2 isolates by 3074 increased with increased dose of sCD4. Wu *et al.* [2008] (**neutralization**, **variant cross-recognition or cross-neutralization**)
- 3074: This MAb was derived from plasma from a patient with env clade A virus with the GPGQ V3 motif. When cross-reactivity was tested, this Ab bound to both the V3subtypeB-fusion protein containing GPGR motif and V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize both clade B psSF162 (GPGR) and clade C psMW965 (GPGQ) virus, and two of subtype B and four of non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 3074: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, no neutralization was observed of the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, H, C, CRF02_AG and CRF01_AE) and SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 412d: Docking of a functional 14-residue CCR5 N-terminus peptide to the crystal structure of gp120-CD4 in complex with sulfated MAb 412d showed that the peptide binds to the base of the V3 loop in a manner similar to that of 412d. To improve peptide stability, sulfo-tyrosine isosteres were incorporated into the peptide, and its solubility was improved by incorporation of an orthogonally functionalized azido tris (ethylenoxy) L-alanine residue. 412d was able to compete and inhibit peptide binding to gp120-CD4. The peptide was used to develop screening assays for small molecule inhibitors of HIV-1 gp120 and CCR5 interactions. Lam *et al.* [2008] (**antibody binding site definition and exposure**, **co-receptor**, **structure**)
- 412d: Nuclear magnetic resonance and x-ray crystallography used to analyze the structure of the CCR5 N terminus and 412d in complex with gp120 and CD4 revealed surprisingly different conformations of tyrosine-sulfated regions of CCR5 and 412d. However, a critical sulfotyrosine on CCR5 (residue 14) and on 412d (residue 100c) induced similar structural rearrangements in gp120. Futrhermore, the gp120 residues that line the sulfotyrosine binding pocket were highly conserved. The structural analyses indicate that engagement of the CCR5 N terminus by gp120 requires formation of a conserved pocket for sulfotyrosine binding, and converts the flexible V3 stem into a rigid β-hairpin. Huang *et al.* [2007a] (**antibody binding site definition and exposure**, **structure**)
- 412d: 412d structure, sulfation, and binding are reviewed in detail. Lin & Nara [2007] (**review**)
- 412D: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. 412D neutralization properties and binding to HIV-1 envelope, and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- 412d: The CDR3 regions of CD4i Abs (E51, 412d, 17b, C12 and 47e) were cloned onto human IgG1 and tested for their ability to inhibit CCR5 binding. Only E51 successfully immunoprecipitated gp120. Dorfman *et al.* [2006] (**co-receptor**)
- 412d: The structure of the V3 region in the context of gp120 core complexed to the CD4 receptor and to the 412d Ab was attempted to be determined by X-ray resolution, but only the structure for V3 complexed with CD4 and X5 Ab was solved. Huang *et al.* [2005a] (**structure**)
- 412d: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**, **review**)
- 412d: Binding of 412d to gp120 requires the gp120 β19 strand and the base of the V3 loop, indicating that the epitope for this Ab includes these two regions. The major determinants of 412d preference for CCR5-using HIV-1 strains were determined to be amino acid residues 325 and 326 in the base of the V3 loop. The close mimicry of the CCR5 N terminus by 412d was emphasized by showing that replacement of the CCR5 N terminus by 412d heavy chain CDR3 loop resulted in

B Cell

a functional HIV-1 co-receptor. Xiang *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**)

- 412d: 412d was obtained from an HIV-1 infected individual with a potent ELISA response to the gp120. It was shown that this MAb heavy chain is sulfate-modified. The sulfates of 412d were present exlusively on tyrosines of its heavy chain CDR3 and they contributed to the binding of this MAb to the gp120 of at least three primary HIV isolates. Binding efficiency of 412d to ADA gp120 was doubled in the presence of CD4, showing that this MAb is a CD4-induced. Association of 412d with ADA gp120-CD4-Ig complex was partially inhibited by a sulfated peptide with a sequence corresponding to the CCR5 amino terminus, indicating that 412d binds a CD4-enhanced epitope overlapping the binding domain of CCR5 amino terminus. Neutralization assays showed that 412d neutralizes primary R5 and R5X4 isolates more efficiently, and X4 isolates less efficiently, than CD4i Abs 17b and 48d. Furthermore, 412d scFv was more than 10 times as potent as full-length 412d at neutralizing ADA. scFv 412d was shown to efficiently bind to gp120 of three R5 isolates but not to the HXBc2 X4 isolate. Choe *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**)

- 47e: 47e structure, sulfation, and binding are reviewed in detail. Lin & Nara [2007] (**review**)
- 47e: The CDR3 regions of CD4i Abs (E51, 412d, 17b, C12 and 47e) were cloned onto human IgG1 and tested for their ability to inhibit CCR5 binding. Only E51 successfully immunoprecipitated gp120. Dorfman *et al.* [2006] (**co-receptor**)
- 47e: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**, **review**)
- 47e: 47e was obtained from an HIV-1 infected individual with a potent ELISA response to the gp120. It was shown that this MAb heavy chain is sulfate-modified and that the sulfation is dependent upon a single tyrosine in its heavy chain CDR3.The sulfate on 47e was shown to substantially contribute to this MAb's ability to bind ADA, but not YU2, envelope glycoprotein. Binding efficiency of 47e to ADA gp120 was doubled in the presence of CD4, showing that this MAb is a CD4-induced. Association of 47e with ADA gp120-CD4-Ig complex was partially inhibited by a sulfated peptide with a sequence corresponding to the CCR5 amino terminus, indicating that 47e binds a CD4-enhanced epitope overlapping the binding domain of CCR5 amino terminus. Choe *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**)

- 8K8: The neutralization activity of 8K8 is additive with that of N36Mut(e,g) peptide, which is a class 3 inhibitor that disrupts trimerization of the N-heptad repeat (N-HR) in the prehairpin intermediate by sequestering the N-HR into N-HR/N36Mut(e,g) heterodimers. The IC50 for 8K8 alone was estimated to 400 nM, while the IC50 for 8K8 and N36Mut(e,g) in combination was 0.9 nM. Gustchina *et al.* [2008] (**neutralization**)
- 8K8: scFv 8K8 was derived from a rabbit Fab phage display library prepared using the bone marrow RNA extracted from N35ccg-N13 immunized rabbits. The library was screened with N35ccg-N13 peptide, which is a soluble homotrimer corresponding to the HIV-1 gp41 N-heptad repeat (NHR) region. 8K8 bound to N35ccg-N13 but not to recombinant r-gp41 (HXB2) nor to 6-Helix, indicating that 8K8 has a strong preference for gp41 NHRtrimers unoccupied by peptide corresponding to the C-heptad repeat (CHR). In contrast, an IgG engineered form of 8K8 showed weak reactivity with r-gp41 and 6-Helix. 8K8 did not recognize soluble forms of Envs used in typical binding assays, which indicates that the 8K8 epitope is occluded in these Envs. Competition experiments showed that Fab DN9, 8K8, and D5 bind to overlapping but

B Cell

distinct epitopes on the NHR coiled-coil mimetics, where the epitopes of DN9 and 8K8 are more closely related to each other than to D5. Immobilized IgG 8K8 did not capture infectious whole HIV-1 virions in presence or absence of sCD4, indicating that 8K8 epitope is restricted on the NHR trimer on the virion surface. 8K8 has a short CDR H3 (7 residues), and its epitope was suggested to be located in a relatively restricted region of NHR near to the hydrophobic pocket. H564 residue in the NHR region was found critical for 8K8 recognition. In neutralization assays, 8K8 showed modest but relatively broad neutralization, including HIV-1 isolates from both subtypes B and C. HIV-1 JR-FL was resistant to neutralization by 8K8. Neutralization potencies of scFv 8K8 and IgG 8K8 were comparable. Neutralization potency of 8K8 was 1 or 2 orders of magnitude less than that of 4E10. Unlike non-neutralizing Abs in this study, whose heavy chain variable regions were encoded by usually expressed VH1a1 and VH1a2 genes, 8K8 was encoded by a rarely expressed VH gene. Nelson *et al.* [2008] (**antibody binding site definition and exposure**, **antibody generation**, **neutralization**, **binding affinity**, **antibody sequence variable domain**)

- 97B1/E8: Transgenic mice (strain XenoMouse G2) carrying human genes allowing production of fully human IgG2κ MAbs were used to rapidly create a panel of anti-HIV gp120 MAb-producing hybridomas by immunization with HIV SF162 gp120. Three of the MAbs were conformation dependent, but did not block sCD4 binding and were part of the same competition group. These MAbs were all raised against a deglycosylated form of gp120. They could not neutralize autologous SF162 and bound some R5 and X4 B clade viruses, and no E clade viruses. He *et al.* [2002]

- A12: A12 is a neutralizing VHH (nanobody) Ab devoid of light chains. It was isolated from sera from llamas, who produce immunoglobulins devoid of light chains, immunized with gp120 of HIV-1 CRF07_BC primary isolate CN54, following panning of phage libraries expressing VHH repertoire and a competitive elution with soluble CD4. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. A12 was able to neutralize HIV-1 primary isolates of subtypes B, C and CRF07_BC, but not subtypes A, D, and A/G. Compared to MAb b12, which neutralized 54% of viruses tested, A12 neutralized 42% of the viruses, but it neutralized a different spectrum of the viruses than b12. A12 showed high affinity binding to IIIB gp120, and inhibited binding of sCD4 to IIIB gp120 and 92UG037 gp140 in a dose-dependent manner. A12 was found to compete with b12 for binding to gp120, and also with MAbs 654-D and GP68, indicating that its epitope overlaps the CD4bs. There was some inhibition observed of A12-gp120 binding by 2G12, 17b, and 447-52D, while 4E10 did not inhibit A12-gp120 binding. A12 was also able to inhibit binding of the other two VHH Abs isolated in this study, D7 and C8, indicating that their epitopes overlap. - ADP421: A set of oligomeric envelope proteins were made from six primary isolates for potenial use as vaccine antigens: 92/UG/037 (clade A), HAN2/2 (clade B), 92/BR25/025 (clade C), 92/UG/021 (clade D), 93/BR/029 (clade F) and MVP5180 (clade O). This was one of a panel of MAbs used to explore folding and exposure of well characterized epitopes. The clade C isolate BR25 is apparently misfolded, as conformation-dependent antibodies did not bind to it. ADP421 is a polyclonal rabbit sera raised against CHO-derived IIIB gp120. ADP421 bound to antigens from all clades A-F, as well as group O. Polyclonal sera raised in rabbits against these antigens cross-bound the other antigens, but none of the sera had neutralizing activity. - AH48: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs and sCD4 were able to shift JR-FL trimers, In contrast, most non-neutralizing Fabs, AH48 in particular, bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- AH48: This Ab was shown not to react with C clade gp140 (97CN54). Sheppard *et al.* [2007b] (**variant cross-recognition or cross-neutralization**)
- AH-48: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. AH48 is a novel anti-V3 Fab first used in this study. Zwick *et al.* [2003] (**antibody generation**, **antibody interactions**)

- CD4-IgG2: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. There was no difference in CD4-IgG2 binding to wild type and mutant JR-FL, and CD4-IgG2 inhibited infection of the two pseudoviruses with comparable potencies. Dey *et al.* [2008] (**binding affinity**)
- CD4-IgG2: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by CD4-IgG2, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. Both escape mutant viruses were unchanged in their sensitivity to neutralization by CD4-IgG2 compared to parental and control viruses. Binding of CD4-IgG2 to each of the gp120 proteins was comparable. Pugach *et al.* [2008] (**co-receptor**, **neutralization**, **binding affinity**)
- CD4-IgG2: The neutralization profile of early R5, intermediate R5X4, and late X4 viruses from a rhesus macaque infected with SHIV-SF162P3N was assessed. The parental R5 virus was neutralized by by CD4-IgG2 but with the 40-fold lower potency than the R5X4 intermediate and the late X4 virus, which were neutralized with equal potency. The enhanced neutralization susceptibility of the dual-tropic and the X4 viruses to CD4-IgG2 suggests adoption of an increasingly open conformation of the Env gp120 over time. Tasca *et al.* [2008] (**co-receptor**, **neutralization**)
- CD4-IgG2: A D386N change in the V4 region, which results in restoration of N-glycosylation at this site, resulted in a 2-fold increase in resistance to neutralization of a mutant virus by CD4-IgG2 compared to wildtype. There was no association between increased sensitivity to CD4-IgG2 neutralization and enhanced macrophage tropism. Dunfee *et al.* [2007] (**neutralization**)
- CD4-IgG2: Deletion of glycosylation site in position 386 (N386Q) in two different subtype C envelope clones resulted in a decrease in sensitivity of corresponding viruses to neutralization by CD4-IgG2. Gray *et al.* [2007b] (**neutralization**)
- CD4-IgG2: The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. Chimeric Env-pseudotyped virus Ch5, containing all three of the mutations, was less neutralization sensitive to CD4-IgG2 than Ch2, which did not contain any of these mutations. Any Env-pseudotyped viruses containing D457G mutation were markedly resistant to neutralization by CD4-IgG2, while viruses containing E440G and H564N were neutralization sensitive. Also, binding of CD4-IgG2 to any gp120 that contained D457G mutation was severely disrupted. Beddows *et al.* [2005b] (**neutralization**, **binding affinity**)
- CD4-IgG2: Furin co-transfection did not have an effect on the reactivity of Δ140ct HXBc2 and 3.2P pseudoviruses with CD4-IgG2. Herrera *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- CD4-IgG2: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **review**)
- CD4-IgG2: This is a recombinant Ab-like fusion protein in which the heavy- and light-chain variable domains of human IgG2 have been replaced with the D1D2 domains of human CD4. Affinity of this Ab to gp120 did not increase in any of the gp120-mutants studied. 29 mutations in the gp120 resulted in decrease (20-50%) in CD4-IgG2 binding affinity, indicating loss of certain functional features required to maintain CD4BS. Some gp120-mutations increased and some decreased its neutralization by this Ab, however, neutralization and binding affinity did not correlate. Pantophlet *et al.* [2003a] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)

- CO11: CO11 neutralized two of the 15 subtype B isolates tested, 93TH305 and 92BR020c. Binding affinity of MAb CO11 to gp120 was strongly reduced upon substitutions of His308, Pro313 (500-fold), or Arg315 to Ala. The dependence on Pro313 suggests that a precise conformation of the V3 β hairpin turn may be critical for binding of CO11. Thus, CO11 may need to interact with V3 from an angle, which does not permit access to V3 on many different primary viruses. CO11 inability to neutralize 6 of the 15 viruses tested could not be explained by substitution of important contact residues. The fine specificity of CO11 was mapped onto V3 in the structural context of gp120. This showed that the residues important for CO11 binding form a somewhat disjointed pattern, and that CO11 likely also contacts neighboring residues. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **structure**)
- CO11: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. CO11 belonged to the group 3 MAbs, which are able to bind subtype B but not subtype C gp120 and V3 peptide. CO11 was able to bind subtype B V3 in the subtype C Env backbone chimera, but not the reverse, indicating that CO11 binds to a structure created by the subtype B V3 sequence that is not impacted by the gp120 backbone. For both subtypes B and C, CO11 required H13 and R18 residues in order to bind, indicating that these residues likely define key aspects of the Ab epitope. CO11 was not able to neutralize JR-FL or SF162 isolates, but a chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. Patel *et al.* [2008] (**neutralization**, **binding affinity**, **subtype comparisons**)
- CO11: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. CO11 has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- CO11: A reverse capture assay was developed to asses what kind of human MAbs were produced in EBV B-cell transformation assays performed on PBMC sampled at different timepoints from three HIV-1 infected patients on HAART. The reverse capture assay was validated by the solid phase MAbs that could not capture biotin-MAbs of the same or overlapping specificity when reacted with patient virus envelope glycoproteins preincubated with or without sCD4. Reverse capture assay showed that the produced Abs from the patients were able to block binding of biotin-labeled CO11, however the blocking was low, indicating presence of relatively few V3-binding Abs. Robinson *et al.* [2005] (**antibody generation**, **assay development**, **HAART, ART**)
- CO11: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only 3 additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including CO11. Keywords isotype switch, mucosal immunity, neutralization

- D10: Several IgG MAbs were isotype switched to IgA and tested for their abilities to generate immune complexes with HIV-1 and be excreted from polarized epithelial cells from the basolateral to the apical surface via polymeric Ig receptor (pIgR) binding. IgA D10 showed robust excretion abilities which corresponded to increased binding of D10 to HIV, and,

B Cell

as immune complex with the virus, to pIgR. The excretion of the D10-HIV complex was IgA Ab concentration dependent, as well as time dependent, depending on on the duration of basolateral exposure of the immune complexes. Immune complexes with D10 plus D47 showed synergistic abilities, as the binding and excretion increased significantly with both Abs present than with only one of the Abs. D10 excreted infectious virus, correlating with it being a non-neutralizing Ab. These results show that IgA Abs have potential to excrete HIV from mucosal lamina propria thus decreasing the viral burden and access to susceptible cells. Wright *et al.* [2008] (**isotype switch**, **mucosal immunity**)

- D10: By isotype switching, IgG and IgA variants of D10 were produced. Both D10 IgA and IgG showed no significant neutralization of virus in conventional neutralization assays nor did they show any capability of intracellular neutralization of HIV-1. D10 IgA was, however, efficiently transported into the cells, but showed no colonization with HIV protein. D10 IgA did not significantly inhibit production of virus. Huang *et al.* [2005b] (**isotype switch**, **neutralization**, **mucosal immunity**)

Keywords antibody binding site definition and exposure, binding affinity, neutralization, structure, variant cross-recognition or cross-neutralization

- D5: IgG D5 bound to recombinant r-gp41 (HXB2) and to to 6-Helix. D5 did not recognize soluble forms of Envs used in typical binding assays, which indicates that the D5 epitope is occluded in these Envs. Competition experiments showed that Fab DN9, 8K8, and D5 bind to overlapping but distinct epitopes on the NHR coiled-coil mimetics, where the epitopes of DN9 and 8K8 are more closely related to each other than to D5. Immobilized D5 did not capture infectious whole HIV-1 virions in presence or absence of sCD4, indicating that D5 epitope is restricted on the NHR trimer on the virion surface. In neutralization assays, D5 showed modest but relatively broad neutralization, including HIV-1 isolates from both subtypes B and C. Neutralization potency of D5 was 1 or 2 orders of magnitude less than that of 4E10. NHR mutant residues L568A and K574A induced resistance to neutralization by D5. Nelson *et al.* [2008] (**neutralization**, **binding affinity**)
- D5: A human scFv designated D5 was selected from phage libraries using gp41-based peptides. When convertrd to IgG1 it retained antiviral activity. D5-IgG1 neutralized laboratory and primary isolates of HIV-1, including isolates from subtypes B, C, F and CRFs AE and BF. The gp41 interaction surface of D5-IgG was a conformational epitope overlapping the HR1 hydrophobic pocket. The epitope was shown to be highly conserved in HIV-1. Mutation of key pocket residues of gp41 conferred resistance to neutralization by D5. - D7: D7 is a neutralizing VHH (nanobody) Ab devoid of light chains. It was isolated from sera from llamas, who produce immunoglobulins devoid of light chains, immunized with gp120 of HIV-1 CRF07_BC primary isolate CN54, following panning of phage libraries expressing VHH repertoire and a competitive elution with soluble CD4. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. D7 was able to neutralize HIV-1 primary isolates of subtypes B, C and CRF07_BC, but not subtypes A, D, and A/G. Compared to MAb b12, which neutralized 54% of viruses tested, D7 neutralized 31% of the viruses, but it neutralized a different spectrum of the viruses than b12. D7 showed high affinity binding to IIIB gp120, and inhibited binding of sCD4 to IIIB gp120 and 92UG037 gp140 in a dose-dependent manner. D7 was found to compete with b12 for binding to gp120, and also with MAbs 654-D and GP68, indicating that its epitope overlaps the CD4bs. There was some inhibition observed of D7-gp120 binding by 2G12, 17b, and 447-52D, while 4E10 did not inhibit D7-gp120 binding. D7 was also able to inhibit binding of the other two VHH Abs isolated in this study, A12 and C8, indicating that their epitopes overlap. - DN9: Fab DN9 was derived from a human Fab phage display library prepared using the bone marrow RNA extracted from an HIV-1 positive individual. The library was screened with N35ccg-N13 peptide, which is a soluble homotrimer corresponding to the HIV-1 gp41 NHR region. DN9 bound to N35ccg-N13 but not to recombinant r-gp41 (HXB2) nor to 6-Helix, indicating that DN9 has a strong preference for NHR trimers unoccupied by peptide corresponding to the C-heptad repeat (CHR). Confirming this, DN9 did not recognize soluble forms of Envs used in typical binding assays, which also indicates that the DN9 epitope is occluded in these Envs. Competition experiments showed that Fab DN9, mAb 8K8, and D5 bind to overlapping but distinct epitopes on the NHR coiled-coil mimetics, where the epitopes of DN9 and 8K8 are more closely related to each other than to D5. DN9 epitope was found distinct from the non-neutralizing Abs in this study, as DN9 does not bind to gp41, gp140, or gp160 as the non-neutralizing Ab did. DN9 has a long CDR H3 (20 residues), and its epitope was suggested to be located in a relatively restricted region of NHR near to the hydrophobic pocket. In neutralization assays, DN9 showed modest but relatively broad neutralization, including HIV-1 isolates from both subtypes B and C. - F2A3: F2A3 neutralized two of the 15 subtype B isolates tested, 93TH305 and 92BR020c. Binding affinity of MAb F2A3 to gp120 was strongly reduced upon substitutions of His308, or K305 to Ala, suggesting that the F2A3 epitope overlaps mostly with the N-terminal flank of the V3 region. Binding of F2A3 was substantially enhanced by substitutions I309A, F317A, Y318A, and D325A, indicating that their interaction with neighboring residues likely affects how well F2A3 epitope is presented. F2A3 inability to neutralize 5 of the 15 viruses tested could not be explained by substitution of important contact residues. The fine specificity of F2A3 was mapped onto V3 in the structural context of gp120. This showed that the residues important for F2A3 binding form a nearly linear arrangement on the V3 structure, and that the residues that increased Ab binding when changed to Ala are crowded around the linear arrangement, suggesting an important role of the adjacent residues for contact residue positioning. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **structure**)
- F2A3: Yeast display was compared to phage display and shown to select all the scFv identified by phage display and additional novel antibodies. F2A3 was used in competition assays to determine the binding region of the MAbs selected from the yeast displayed antibody library. Bowley *et al.* [2007]
- F2A3: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. F2A3 was shown to bind specifically only to CON6 and subtype A gp140CFIs. No specific binding was observed for the CON-S nor for the rest of the recombinant proteins and the two subtype B gp120 proteins. - F3.9F: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. F3.9F belonged to the group 1 MAbs, which are able to bind both subtype B and C gp120 proteins and peptides. F3.9F was also able to bind both subtype C V3 in the subtype B Env backbone chimera, and reverse, indicating that F3.9F binds to V3 in a way that is not affected by the gp120 backbone. For subtype B, changes in the position 13 (H13R) and/or position 18 (R18Q) showed no difference of F3.9F binding compared to wildtype. For subtype C, H13 residue enhanced binding of F3.9F, but the R18 mutation reduced binding, indicating that R18 affects the conformation of V3 subtype C. Although F3.9F bound to JR-FL V3, this isolate was resistant to neutralization by F3.9F. F3.9F was able to neutralize SF-162, and a chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. Patel *et al.* [2008] (**neutralization**, **binding affinity**, **subtype comparisons**)

- F425: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. V3 Ab activity was measured by three assays where F425 was used as a control. Binley *et al.* [2008] (**neutralization**)
- F425-B4e8: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. F425-B4e8 captured significantly fewer mutant pseudovirions than wild type, but F425-B4e8 inhibited infection of the two pseudoviruses with comparable potencies. Dey *et al.* [2008] (**binding affinity**)
- F425-B4e8: A mathematical model was developed and used to derive transmitted or founder Env sequences from individuals with acute HIV-1 subtype B infection. All but three of the transmitted or early founder Envs were resistant to neutralization by F425-B4e8, indicating that the coreceptor binding surfaces on transmitted/founder Envs are conformationally masked. sCD4 could trigger a conformational change in gp120 of these Envs and render the virus susceptible to neutralization by F425-B4e8. Keele *et al.* [2008] (**neutralization**, **acute/early infection**)
- F425 B4e8: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. F425 B4e8 belonged to the group 1 MAbs, which are able to bind both subtype B and C gp120 proteins and peptides. F425 B4e8 was able to bind both subtype C V3 in the subtype B Env backbone chimera, and reverse, indicating that F425 B4e8 binds to V3 in a way that is not affected by the gp120 backbone. For subtype B, changes in the position 13 (H13R) and/or position 18 (R18Q) showed no difference of F425 B4e8 binding compared to wildtype. For subtype C, H13 residue enhanced binding of F425 B4e8, but the R18 mutation reduced binding, indicating that R18 affects the conformation of V3 subtype C. F425 B4e8 did not neutralize JR-FL isolate, but did neutralize SF162. A chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by F425 B4a1, suggesting an important role of one or more of the three V3 amino acids that differ between these two isolates in defining the epitope and/or structure of the protein. Patel *et al.* [2008] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- F425: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by F425, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes

B Cell

for its resistance. None of the control or resistant viruses were sensitive for neutralization by F425, although F425 bound strongly to gp120 from CC1/85 and CC101.19. These results indicate that V3-dependent and -independent changes responsible for CCR5 inhibitor resistance do not necessarily alter the exposure of V3 to some of the V3 Abs. Pugach *et al.* [2008] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**, **binding affinity**)

- F425 B4e8: Peptides containing the V3 epitope for F425 B4e8 did not inhibit neutralization by broadly neutralizing sera from two clade B and one clade A infected asymptomatic individuals. Dhillon *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**)
- F425-B4e8: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, a summary of the neutralizing activity of mAb F425-B4e8 in different HIV-1 clades is provided. McKnight & Aasa-Chapman [2007] (**variant cross-recognition or cross-neutralization**, **review**)
- F425 B4e8: The neutralization breadth of F425 B4e8 was assessed using a panel of 40 primary HIV-1 isolates. The Ab neutralized 8/16 clade B, 1/11 clade C and 2/6 clade D viruses, and its neutralization activity was comparable to mAb 447-52D. In contrast to previous reports, it is suggested here that F425 B4e8 interacts primarily with the crown/tip of V3, based on the scanning mutagenesis analyses of the V3 region, in particular with Ile309, Arg315, and Phe317. Pantophlet *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **optimal epitope**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- F425 B4e8: This Ab was shown to inhibit HIV-1 BaL replication in both macrophages and PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs can occur by two distinct mechanisms, neutralization of infectivity involving only the Fab part of the IgG, and, an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**dendritic cells**)
- F425b4e8: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in increased relative neutralization resistance of the LLP-2 mutant virus to F425b4e8, compared with wildtype virus. The increased neutralization resistance of LLP-2 virus was associated with decreased F425b4e8 binding to its epitope. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- F425: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**neutralization**, **variant cross-recognition or cross-neutralization**, **review**)
- F425 B4e8: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V3 MAbs (447-52D, 19b, F245-B4e8 and 39F) bound to the GDMR antigen, but either did not bind or had diminished binding to mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- F425b: This Ab recognized gp120 glycoproteins from CCR5-using MN, ADA and YU2 strains and from the dual-tropic 89.6 strain, but it did not recognize the gp120 from the CXCR4-using HXBc2. gp120 from HXBc2 containing the V3 loop of YU2 strain was efficiently recognized by F425b, indicating the role of the V3 loop in recognition of CCR5 strains by this Ab. Changing the residues 325 and 326 at the base of the V3 loop from the amino acids predominant in the CXCR4-using strains to amino acids predominant in the CCR5-using strains did not result in binding of F425b. Xiang *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**)
- F425 B4e8: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including F425 B4e8. This MAb bound to the initial construct, but introduction of glycosylation sites at positions 320 and 325 inhibited binding. Pantophlet *et al.* [2004]

- F425 B4a1: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. F425 B4a1 belonged to the group 1 MAbs, which are able to bind both subtype B and C gp120 proteins and peptides. F425 B4a1 was able to bind both subtype C V3 in the subtype B Env backbone chimera, and reverse, indicating that F425 B4a1 binds to V3 in a way that is not affected by the gp120 backbone. For subtype B, changes in the position 13 (H13R) and/or position 18 (R18Q) showed no difference of F425 B4a1 binding compared to wildtype. For subtype C, H13 residue enhanced binding of F425 B4a1, but the R18 mutation reduced binding, indicating that R18 affects the conformation of V3 subtype C. F425 B4a1 did not neutralize JR-FL isolate, but did neutralize SF162. A chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by F425 B4a1, suggesting an important role of one or more of the three V3 amino acids that differ between these two isolates in defining the epitope and/or structure of the protein. Patel *et al.* [2008] (**neutralization**, **binding affinity**, **subtype comparisons**)

- F425B4a1: This Ab was shown to inhibit HIV-1 BaL replication in macrophages but not in PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication occurs by an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)

- F530: F530 neutralized 5 of the 15 subtype B isolates tested. Binding affinity of MAb F530 to gp120 was diminished by similar substitutions as for MAbs CO11, F2A3, LA21 and LE11. However, the binding affinity of F530 was not diminished by the His308 to Ala change. F530 inability to neutralize 6 of the 15 viruses tested could not be explained by substitution of important contact residues. The fine specificity of F530 was mapped onto V3 in the structural context of gp120. The map was similar to the maps of MAbs CO11, F2A3, LA21 and LE311, however, the ability of F530 to bind V3 without requiring the presence of Arg315 suggests that F350 interacts mostly with the N-terminal flank of the V3 loop. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **structure**)

- Fab 3674: The IC50 for bivalent Fab 3675 (bF-3674) in a standard neutralization assay is 88nM and is only minimally affected in the postattachment neutralization assay. The neutralization half-life for bF-3674 is 20.6 minutes and is increased 30% to 27.7 minutes in the presence of N36Mut(e,g) peptide, which is a class 3 inhibitor that prolongates temporal window of neutralization by disrupting trimerization of the N-heptad repeat (N-HR) in the prehairpin intermediate by sequestering the N-HR into N-HR/N36Mut(e,g) heterodimers. Both HXB2 and HIV-1 primary isolates of subtypes B and C were neutralized synergistically by bF-3674 and N36Mut(e,g). HXB2 was also neutralized synergistically by bF-3674 and CD4. Gustchina *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **kinetics**)
- Fab 3674: Fab 3674 was selected from a human phage library by panning against a chimeric construct that exposes coiled-coil of gp41 N helices. The epitope for the Fab 3674 comprises of: E560, H564, W571, K574 and Q575, and is located in the shallow groove on the N helices, exposed between two C helices in the fusiogenic six-helix bundle conformation of gp41. Fab 3674 had broadly neutralizing activity against several subtype B isolates, and also subtypes A and C, as its epitope is conserved among these subtypes. A fusion inhibitor (C34) and Fab 3674 were shown to have additive and synergistic actions on the fusion inhibition of HIV-1. - H211: To examine sequence and conformational differences between subtypes B and C, several experiments were preformed with 11 MAbs regarding binding and neutralization. Both binding and neutralization studies revealed that the 11 MAbs could be divided in three different groups, and that the most differences between the subtypes were located in the stem and turn regions of V3. H211 belonged to the group 2 MAbs, which are able to bind subtype B but not subtype C gp120, and are able to bind both V3 peptides. For subtype B, H211 required an R18 residue in order to bind, but the binding was not significantly affected by the H13R change. For subtype C, Q18R mutation did not restore binding to gp120, but the R13H-Q18R double mutation did. Peptide binding was affected only by the R13H mutation, indicating that the poor binding of Q18R gp120 mutant has a structural basis. H211 was not able to neutralize JR-FL isolate, but neutralized SF162. A chimeric SF162 variant with a JR-FL-like V3 sequence was hypersensitive to neutralization by this Ab. Keywords antibody interactions

- 4G6: Hybridoma cell lines from trans-chromosome knock-out mice immunized with HIV-1 infected cells produced two human mAbs, 9F11 and 2G9, that reacted with HIV-1 infected cells. 2G9 induced apoptosis of HIV-1 infected cells and 9F11 was able to induce complement-mediated cytolysis. None of the mAbs are thought to bind directly to HIV-1. Unlike 2G9, 4G6 did not react with OM10.1 cells maintained in a latently infected state in the presence of AZT, but it did react when the virus replication was activated in the absence of AZT and in the presence of TNF-α. Okada *et al.* [2005] (**antibody interactions**)
- IVI-4G6: A bi-specific Ab (BFA) was made by combining Fab fragments of gp41-specific MAb IVI-4G6 and CD3-specific Mab UCHT1 – the BFA suppressed HIV-1 propagation culture and eliminated latently infected cells. Yin *et al.* [2001]

Keywords antibody binding site definition and exposure, binding affinity, neutralization, structure, variant cross-recognition or cross-neutralization

- LA21: LA21 neutralized two of the 15 subtype B isolates tested. Binding affinity of MAb LA21 to gp120 was strongly reduced upon substitutions of His308, or Pro313 (250-fold), to Ala. The dependence on Pro313 suggests that a precise conformation of the V3 β hairpin turn may be critical for binding of LA21. Thus, LA21 may need to interact with V3 from an angle, which does not permit access to V3 on many different primary viruses. LA21 inability to neutralize 6 of the 15 viruses tested could not be explained by substitution of important contact residues. The fine specificity of LA21 was mapped onto V3 in the structural context of gp120. This showed that the residues important for LA21 binding form a somewhat disjointed pattern, and that LA21 likely also contacts neighboring residues. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **structure**)

Keywords antibody binding site definition and exposure, antibody generation, assay standardization/improvement, binding affinity, neutralization, structure, vaccine antigen design, variant cross-recognition or cross-neutralization

- LE311: LE311 neutralized three of the 15 subtype B isolates tested. Binding affinity of MAb LE311 to gp120 was strongly reduced upon substitutions of His308, Pro313, or K305 to Ala, suggesting that the LE311 epitope overlaps mostly with the N-terminal flank of the V3 region and that a precise conformation of the V3 β hairpin turn may be critical for Ab binding. Thus, LE311 may need to interact with V3 from an angle, which does not permit access to V3 on many different primary viruses.LE311 inability to neutralize 6 of the 15 viruses tested could not be explained by substitution of important contact residues. The fine specificity of LE311 was mapped onto V3 in the structural context of gp120. This showed that the residues important for LE311 binding form a nearly linear arrangement on the V3 structure. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **structure**)
- LE311: Sera from both gp120 DNA prime-protein boost immunized rabbits and from protein-only immunized rabbits competed for binding to LE311, indicating elicitation of LE311-like Abs by both immunization regimens. Competitive virus capture assay revealed higher titers of LE311-like Abs in animals immunized with DNA prime-protein boost than in protein-only immunized animals. Vaine *et al.* [2008] (**vaccine antigen design**)
- LE311: Guinea pigs were immunized with gp120 protein, or with three types of VLPs containing disulfide-shackled functional trimers (SOS-VLP), uncleaved nonfunctional Env (UNC-VLP), naked VLP bearing no Env. LE311 was used in a capture assay showing that most of the SOS-VLP and UNC-VLP sera contained high titers of anti-V3 Abs. gp120 sera showed only moderate titers of V3 competing Abs. Crooks *et al.* [2007] (**neutralization**)
- LE311: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). LE311-like Abs were present in low titers in sera from gp140 immunized animals and in higher titers in the SHIV-infected animal. LE311 captured JRFL more efficiently when the virus was pre-incubated with sCD4. Derby *et al.* [2006] (**antibody generation**, **neutralization**)
- LE311: LE311 was investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. LE311 dramatically neutralized in the post-CD4 format but did not have any activity in the standard format. LE311 did not have any activity in the post-CD4/CCR5 format. This suggests that the post-CD4, pre-CCR5 phase of infection is a narrow window of opportunity for neutralization of JR-FL by LE311 Ab. Addition of a disulfide bridge linking gp120 and gp41 resulted in detectable activity of LE311 in the standard format. Visualization of Env-Ab binding was conducted by BN-PAGE band shifts. Keywords antibody binding site definition and exposure, binding affinity, subtype comparisons

- LF17: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. The magnitude of LF17 binding to subtype C trimer was lower than to subtype B trimer, either in the presence or absence of CD4. However, the fold increase in binding of LF17 in presence of CD4 was similar for both subtypes, indicating similar structural rearrangements. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed

B Cell

cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)

- LF17: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. LF17 has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)

- M2: This antibody is specific for a peptide flag inserted into the V4 loop of YU-2, a neutralization resistant variant with a short V4 loop. IgG1b12 and 2F5 could neutralize both the WT YU-2 and the modified variant. The high diversity of V4 suggests it does not play a direct role in receptor binding or viral entry, yet M2, specific for the peptide insert tag, can neutralize the modified virus, demonstrating that neutralizing activity doesn't have to block funtionality of the virus. - N2: Fab N2 was derived from a human Fab phage display library prepared using the bone marrow RNA extracted from an HIV-1 positive individual. The library was screened with N35ccg-N13 peptide, which is a soluble homotrimer corresponding to the HIV-1 gp41 NHR region. N2 bound to N35ccg-N13 and to recombinant r-gp41 (HXB2). N2 did not neutralize HXB2. As other human-derived Abs in this study, N2 has a long CDR H3 (19 residues), and it was shown to bind to Envs used in typical epitope binding assays, unlike the neutralizing Abs in this study. While N2 had no observable reactivity with a peptide corresponding to the C-heptad repeat of gp41 (C34), low nanomolar concentrations of C34 were sufficient to induce recognition of IZN36 (another mimetic peptide) by N2. The neutralizing Abs in this study were, however, able to recognize IZN36 without C34. Keywords antibody binding site definition and exposure, binding affinity, neutralization, vaccine antigen design

- PA1: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. PA1 captured significantly fewer mutant pseudovirions than wild type, and PA1 failed to inhibit infection by either pseudovirus. Dey *et al.* [2008] (**binding affinity**)
- PA1: Sera from rabbits immunized with either monomeric gp120, trimeric cleavage-defective gp140 or disulfide-stabilized soluble trimeric gp140 were incubated with bead-immobilized gp120 and cyclic V3 previously shown to be able to deplete this Ab from test serum. The neutralizing activity of the sera was only slightly reduced, indicating that only a minor fraction of Abs in the sera was directed towards the V3 region. Beddows *et al.* [2007] (**neutralization**, **vaccine antigen design**)
- PA1: PA1 was used for probing in Western blot and SDS-PAGE assays of VLP particles containing disulfide-shackled functional Env trimers (SOS-VLPs). Crooks *et al.* [2007]
- PA-1: SOSIP Env proteins are modified by the introduction of a disulfide bond between gp120 and gp41 (SOS), and an I559P (IP) substitution in gp41, and form trimers. The KNH1144 subtype A virus formed more stable trimers than did the prototype subtype B SOSIP Env, JRFL. The stability of gp140 trimers was increased for JR-FL and Ba-L SOSIP proteins by substituting the five amino acid residues in the N-terminal region of gp41 with corresponding residues from KNH1144 virus. b12, 2G12, 2F5, 4E10 and CD4-IgG2 all bound similarly to the WT and to the stabilized JRFL SOSIP timers, suggesting that the trimer-stabilizing substitutions do not impair the overall antigenic structure of gp140 trimers. 17b binding was induced similarly by CD4 for the WT and stabilized forms. Non-neutralizing MAbs PA-1 (V3) and b6 (CD4BS) bound less efficiently to the stabilized trimer. Dey *et al.* [2007a] (**vaccine antigen design**)
- PA1: Western blots were probed with PA1 and B12 to analyze Envs derived from VLPs. Moore *et al.* [2006]
- PA1: This Ab was used in an Ab depletion assay to test whether neutralizing Abs in sera from rabbits immunized with a soluble, cleaved trimeric gp140 (SOSIP gp140) recognized

B Cell

gp120 or its V3 region. Unlike gp120 beads, V3-peptide beads did not remove any of the PA1 from the test-sera, indicating that only a minor fraction of the total anti-gp120 Abs were directed to V3. Beddows *et al.* [2005a] (**antibody binding site definition and exposure**)

Keywords antibody binding site definition and exposure, antibody generation, antibody sequence variable domain, assay standardization/improvement, binding affinity, co-receptor, review

- Sb1: A direct comparison of phage and yeast display libraries was undertaken, and yeast display sampled the immune repertoire more fully. Previous results from panning a phage library generated from a long-term non-progressor were compared directly with a yeast library. As determined by sequencing, many MAbs were common to both, although the yeast library identifies unique scFv. Sb1 was identified using both methods, and is a CD4i antibody. Bowley *et al.* [2007] (**antibody binding site definition and exposure**, **antibody generation**, **binding affinity**, **antibody sequence variable domain**, **assay standardization/improvement**)
- Sb1: Tyrosine sulfation of Sb1 and other Abs, and its effect on Ab binding and neutralization, is reviewed. Lin & Nara [2007] (**review**)
- Sb1: Sb1 was obtained from an HIV-1 infected individual with a potent and broadly neutralizing activity of his serum. It was shown that scFv Sb1 was sulfate-modified and it is implied that the sulfates are localized exclusively within the heavy chain CDR3 region of this MAb. Binding efficiency of scFv Sb1 to ADA gp120 was doubled in the presence of CD4, showing that this MAb is CD4-induced. Association of scFv Sb1 with ADA gp120-CD4-Ig complex was partially inhibited by a sulfated peptide with a sequence corresponding to the CCR5 amino terminus, indicating that Sb1 binds a CD4-enhanced epitope overlapping the binding domain of CCR5 amino terminus. scFv Sb1 was shown to efficiently bind to gp120 of three R5 isolates but not to the HXBc2 X4 isolate. Choe *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**)

- T3: T3 competed with the newly defined neutralizing mAb m44 for binding to gp41. T3 bound strongly to both 5HB and 6HB regions. Zhang *et al.* [2008] (**binding affinity**)
- T3: T3 partially competes with MAb Z13, but not MAb 4E10, both of which bind to gp41 proximally to the 2F5 epitope and have a broad neutralizing potential. Zwick *et al.* [2001b]
- T3: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 timer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-). Yang *et al.* [2000]
- T3: Partially conformation dependent – doesn't bind to short peptides, but does bind to the region spanning 641-683 – binding can be blocked by MAbs D43, D38 and D45 – MAbs in this competition group reacted with 9/10 HIV-1 strains, not binding to JRFL. Earl *et al.* [1997]
- T3: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994]

References Zhang *et al.* 2008; Billington *et al.* 2007; Ohagen *et al.* 2003; Earl *et al.* 1997; Earl *et al.* 1994
Keywords antibody binding site definition and exposure, antibody generation, brain/CSF, escape

- T30: T30 did not compete with the newly defined neutralizing mAb m44 for binding to gp41. Zhang *et al.* [2008]
- T30: Binds to ILAVERY...NNYTS, and binding involves the N-linked carbohydrate at N616. The T30 antibody was used to partially purify a D subtype rgp140 that forms a stable trimer and may be suitable for structural studies. The partially purifed protein was used to immunize mice, and one of the MAbs, 2E2, was used to then further purify the protein. Billington *et al.* [2007]
- T30: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. T30 recognized most variants (10/13) gp41 by WB, and all of the gp160s. Ohagen *et al.* [2003] (**brain/CSF**, **escape**)
- T30: Binds in the region 580 to 640, but does not bind to peptides spanning this region – binding depends on N-linked glycosylation of Asn 616 – no other antibody tested inhibited binding, but binding could be inhibited by sera from HIV+ individuals. Earl *et al.* [1997] (**antibody binding site definition and exposure**)
- T30: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody generation**)

Keywords isotype switch, mucosal immunity

- T33: Several IgG MAbs were isotype switched to IgA and tested for their abilities to generate immune complexes with HIV-1 and be excreted from polarized epithelial cells from the basolateral to the apical surface via polymeric Ig receptor (pIgR) binding. Unlike IgA D10, D47, D19, and D25, IgA T33 was not able to excrete HIV. T33 bound weakly to HIV but the produced immune complex failed to associate with pIgR. These results show that some IgA Abs have potential to excrete HIV from mucosal lamina propria thus decreasing the viral burden and access to susceptible cells. Wright *et al.* [2008] (**isotype switch**, **mucosal immunity**)

Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, vaccine antigen design

- T4: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – T4 recognized o-gp140. Srivastava *et al.* [2002] (**antibody binding site definition and exposure**)
- T4: Soluble gp140 derived from SF162, a neutralization-resistant primary isolate, and SF162AV2 a neutralization-susceptible isolate with 30 amino acids deleted from the V2 loop, were generated with or without the gp120-gp41 cleavage site intact – all forms are recognized by oligomer-specific MAb T4 and show enhanced binding of CD4i MAb 17b when sCD4 is bound – the fused forms are less efficiently recognized than the cleaved forms by polyclonal neutralizing sera from HIV-infected patients – the V3 loop is more exposed on the fused form. Stamatatos *et al.* [2000] (**vaccine antigen design**)
- T4: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – gp41 MAbs T4, D12, T3, and D50 bound less efficiently to gp140-GNC4 than did pooled sera, but T4 and D12 recognized the gp140-GNC4 timer equivalently to gp140(-), and T3 and D50 recognized the trimer at greater levels than gp140(-). Yang *et al.* [2000] (**vaccine antigen design**)
- T4: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**vaccine antigen design**)
- T4: This antibody, along with 7 others (M10, D41, D54, T6, T9, T10 and T35), can block the linear murine MAb D61, and the human MAb 246-D, which both bind to the immunodominant region near the two Cys in gp41 – most of these antibodies are oligomer dependent – all of the MAbs are reactive with ten different HIV-1 strains – members of this competition group are blocked by sera from HIV-1 + individuals. Earl *et al.* [1997] (**antibody interactions**)
- T4: MAbs T4 and T6 bind only to oligomer, and pulse chase experiments indicate that the epitope is very slow to form, requiring one to two hours. Otteken *et al.* [1996] (**antibody binding site definition and exposure**)
- T4: Does not bind to soluble monomeric gp41(21-166) that lacks the fusion peptide and membrane anchor, only to the oligomer gp140, as does T6. Weissenhorn *et al.* [1996] (**antibody binding site definition and exposure**)
- T4: one of five MAbs (T4, T6, T9, T10 and T35) in a competition group that bind to a conformation-dependent epitope in gp41 and is oligomer specific – neutralizes IIIB and SF2. Broder *et al.* [1994] (**antibody binding site definition and exposure**)
- T4: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody generation**)

- m18: m18 structure and binding are reviewed in detail. Lin & Nara [2007] (**review**, **structure**)
- m18: Novel approaches based on sequential (SAP) and competitive (CAP) antigen panning methodiologies, and use of antigens with increased exposure of conserved epitopes, for enhanced identification of broadly cross-reactive neutralizing Abs are reviewed. Abs identified by these methods are described. Zhang & Dimitrov [2007] (**review**)
- m18: This Ab was used to determine the degree to which fixation of gp120 in its CD4-bound conformation restricts antigenic recognition. m18 was not able to bind well to the stabilized gp120. Zhou *et al.* [2007] (**antibody binding site definition and exposure**, **binding affinity**)
- m18: The high resolution crystal structure of Fab m18 was determined and compared to the structure of b12 and F105. Unique conformations of H2 and H3 regions were observed. H2 is highly bulged while H3 shows striking similarity to the CD4 domain D1 that dominates binding of CD4 to gp120. Docking simulations of the m18-gp120 show significant resemblance of the interactions observed in the gp12-CD4 complex, suggesting that m18 mimics some structural features of CD4. Prabakaran *et al.* [2006] (**antibody binding site definition and exposure**, **mimics**, **structure**)
- m18: Called M18. Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the glycan within the V3 loop (GM299 V3) or adjacent to V3 in C2 (GM292 C2), left SF162 susceptible to neturalization by FAb M18, and the glycan mutants in C3 (GM329 C3), C4 (GM438 C4), or V5 (GM454 V5) became resistant to M18 neutralization. The M18 epitope is unknown. V3 glycans tended to sheild V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans sheilded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- m18: m18 was selected from a human Fab phage display library by a new method called sequential antigen panning (SAP), using a series of antigens to screen the library to pick broadly cross-reactive isolates. The epitope of m18 is independent of CD4 binding. The phage display library was constructed using the combined bone marrow of three long term non-progressors with potent NAb activity in their sera. m18 bound to gp140s from primary isolates from clades A-F with nM affinities. The ability to block cell mediated fusion by m18 was compared to Fabs X5 and b12 for a clade A, CRF01 EA, G, and 6 clade B isolates, and the inhibitory activity of m18 was slightly lower but comparable to neutralizing Fabs b12 and X5. It also showed broad cross-neutralization; 11/15 pseudotyped Envs from primary isolates from clades A-F were inhibited in an IC50 assay at concentration less than or equal to 100 ug/ml; X5 was also tested and somewhat more potent, generally requiring lower concentrations and inhibiting 13/15 primary isolates. Zhang *et al.* [2003] (**antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- m36: An HIV-1 neutralizing domain Ab (dAb), m36, was identified from a human antibody variable domain library by panning against Envs from different isolates. The VH m36 bound to gp120-CD4 complexes better than to gp120 alone, and competed with CD4i Abs, indicating its epitope is induced by CD4. m36 neutralized HIV-1 isolates from clades A, B and C with a potency twofold higher than that of the broadly-neutralizing MAb m9. m36 neutralized clade D isolate with lower potency than m9, and did not neutralize clade E HIV-1 isolate. Large-size fusion proteins of m36 exhibited diminished neutralizing activity, suggesting that m36 epitope is sterically restricted. Preincubation of the fusion proteins with sCD4 restored their neutralizing activity. Chen *et al.* [2008b] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)

- m44: The highly neutralizing Ab m44 was isolated by phage library panning, derived from three HIV-1 infected long term nonprogressors with sera with broadest and most potent neutralization. The phage library was panned with uncleaved Env ectodomains and the derived m44 mAb was shown to neutralize primary isolates from different clades with potency significantly higher than that of 4E10 or Z13. m44 neutralized clade C SHIV more potently than 2F5 and b12. The neutralization potency of m44 was significantly higher in PBMC than in TZM-bl cell-line based assay. Site-directed alanine-scanning mutagenesis revealed that the epitope for m44 is conserved, conformational, and is located at the C-HR and a stretch of residues at the C-terminal portion of the loop. m44 did not bind to human self-antigens. - m46: m46 did not compete with the newly detected mAb m44 for binding to gp41. A fusion protein of gp41 constructed for alanine-scanning mutagenesis bound to m46, indicating that its antigenic structure was intact. Zhang *et al.* [2008]
- m46: m46 was identified by screening a phage-displayed antibody library with a gp140 from the donor R2, who had high levels of broadly neutralizing antibodies. m46 binds to a conformational epitope on gp41 and did not compete with 2F5, 4E10 or Z13. It bound to a 5 helix bundle, but not to N-heptad repeat coil-coils or a 6-helix bundle. It is broadly neutralizing, to levels comparable to T20, when tested using PBMC with low CCR5 levels, but less potently when the neutralization assay was performed in a cell line with high CCR5 levels. Isolates from different clades had differing degrees of neutralization sensitivity. Choudhry *et al.* [2007] (**antibody generation**, **neutralization**, **subtype comparisons**, **antibody sequence variable domain**, **assay standardization/improvement**)

B Cell

- SF162ΔV2 is a virus that has a 30 amino acids deletion in the V2 loop that does not abrogate its infectivity but renders it highly susceptible to neutralization—when incorporated into a codon-optimized DNA vaccine with a CMV promoter and delivered by gene gun, SF162ΔV2 gave higher neutralizing Ab titers against SF162 than did SF162 itself, and Abs that cross-neutralized non-homologous primary isolates were obtained only when SF162ΔV2, but not intact SF162, was used as the immunogen—Control MAbs 2F5 and 2G12 could neutralize all of the following primary isolates: 91US056(R5), 92US714(R5), 92US660(R5), 92HT593(R5X4), and BZ167(R5X4), while after the first protein boost, the sera from two SF162ΔV2 immunized macaques could neutralize 91US056(R5), 92US714(R5), 92US660(R5) and ADA(R5), but not 92HT593(R5X4) or 92US657(R5)—the pattern of cross-recognition shifted after the second boost. - In 7/9 patients in whom HAART was initiated during early seroconversion, NAbs to autologous strains were not found immediately following treatment interuption after 1-3 years, and Env and Gag Abs were low or undetected by ELISA indicating, that early HAART suppresses the normal antibody response to HIV-1, presumably by limiting the concentration of viral antigens needed to drive B-cell maturation – in 3 patients with a viral rebound autologous NAbs rapidly appeared and correlated with spontaneous down-regulation of viremia – prolonged control of viremia after stopping treatment persisted in the absence of detectable NAbs, suggesting that cellular immune responses alone can control viremia under certain circumstances – these results support the notion that virus-specific B-cell priming, combined with CD8+ CTL induction, may be beneficial for HIV-1 vaccines that aim to suppress viremia in the absence of complete protection to prevent disease and reduce the rate of virus transmission. Vector/Type: Venezuelan equine encephalitis virus (VEE) *Strain:* B clade R2 *HIV component:* gp160ΔCT
Species (Isotype) rabbit, mouse (IgG)
References Dong *et al.* 2003
Keywords subtype comparisons, variant cross-recognition or cross-neutralization

• Mice and rabbits were immunized with Venezuelan equine encephalitis virus (VEE) replicon system particles expressing HIV-1 Env from the clone R2 that was derived from a virus that was neutralization sensitive and isolated from an individual that made strong NAb resposnes. Stronger and faster NAb responses were induced with replicons expressing gp160 with the cytoplasmic tail deleted than with gp160 or gp140. NAb responses against heterologous strain SF162 were similar in BALB/c and C3H/He mice and enhanced compared to responses elicited in C57BL/6 mice. Serum from mice neutralized 5 primary clade B env proteins, a chinese clade C strain, but not a chinese clade E (CRF-1) strain. Sera from 3/3 immunized rabbits could neutralize SF162, and from 2/3 neutralized the autologous R2 strain. Dong *et al.* [2003] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)

B Cell

- Subcutaneous or intradermal immunization with VEE replicons expressing HIV-1 R2 gp140 and with HIV-1 R2 gp160 lacking the cytoplasmic tail. Sera from 3/3 rabbits inhibited SF162 infectivity and 2/3 rabbits were able to neutralize the R2 strain. Dong *et al.* [2003]
- C3H/He mice immunized with replicons expressing RT env protein or the VEE env vector pGP expressing either gp140 or gp160 showed cross-reactive neutralizing Ab responses to five clade B env proteins, a chinese clade C strain and weakly against a chinese clade E (CRF-1) strain. Keywords autologous responses, escape, rate of progression, responses in children

- A longitudinal study of NAb responses in perinatally HIV-1 infected infants and children was undertaken, including 7 with rapid progression (RP) and 9 who did not progress rapidly (NRP). A subset of both RPs and NRPs had some plasma samples that could neutralize contemporaneous autologous viral isolates after 6 months of age, but most isolates could not be neutralized by contemporaneous plasma, only by later samples. The non-contemporaneous NAbs would persist for years, had highest titers against earlier isolates, and tended to be more potent in NRP children. This study indicates that there is ongoing NAb escape in HIV-1 + children. No correlation between HIV RNA levels and Ab production was established, although this might have been complicated by treatment. Keywords acute/early infection, autologous responses, escape

- AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessation of therapy, which then declined to a low level. The polyclonal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. Keywords vaccine-specific epitope characteristics

- This study compares the immunogenicity of the HIV DH012 strain in chimpanzees during a natural infection with DH012 vaccinations. Naturally infected chimpanzees have sera containing potent anti-DH012 neutralization Abs, but the primary epitope is a discontinuous conformational epitope called CEV that involves the V1/V2 region, the bridging sheet, and the V3 loop. Abs that are raised upon gp120 vaccination, in contrast, are primarily against V3. DH012 has preserved the epitopes for the MAbs IgG1b12, 2G12, 17b, however natural DH012 infection in chimpanzees and DH012 gp120 vaccination in guinea pigs does not give rise to Abs against these epitopes. References McCaffrey *et al.* 2004
Keywords antibody binding site definition and exposure, vaccine antigen design

- Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the glycan within the V3 loop (GM299 V3) and adjacnt to the C-terminal end of the V3 loop (GM329 C3) increased neutralization susceptibility to both sera, but the loss of sites in C2, C4, and V5 did not alter neutralization susceptibility. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. Keywords assay development, assay standardization/improvement

- An antigen panel representing different regions of gp41 was generated, and sera from 23 individuals were screened. Anti-gp41 titers were very high, and sera bound to many regions of gp41, there were no immunologically silent regions. Many individuals had broad responses to diverse regions. High titer responses tended to focus on the N-heptad, C-heptad and 2F5-4E10 regions, but there was no correlation between neutralization capacity of sera and the particular peptides recognized.

Keywords variant cross-recognition or cross-neutralization

- V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 28 sera were tested – 24/28 sera gave greater than 90% neutralization of SF162 at dilutions of 1:180, while only 2/28 could give 90% neutralization of JRFL, and only 9/28 gave 50% neutralization at dilutions of 1:180. A chimera with SF162 V1V2 in a JRFL Env backbone was neutralization sensitive to most sera at a comparable level to SF162 Env, and in some cases the JRFL-SF162 V1V2 chimera was even more sensitive than JRFL. References Rollman *et al.* 2004
Keywords adjuvant comparison, enhancing activity, Th1, Th2, vaccine antigen design, variant cross-recognition or cross-neutralization

- Vaccination of mice with subtype B Env raised antibodies primarily against subtype B alone, while A+B+C clade Envs raised antibodies that could neutralize the autologous B, C strains, and weakly neutralize the A strain. Serum IgG responses to gp120s including all gp120 variable regions were induced in animals vaccinated with subtypes A, B and C of HIV-1 gp160 with rGM-CSF as adjuvant. Boosting with rgp160 with CpG-ODN enhanced IgG responses, shifted the Th1/Th2 to be more balanced, and these animals made both IgG and Ig2a responses and had expanded recognition of constant regions. The B clade vaccine was LAI, and the A and C clade vaccines were actually V1-V5 of the A and C strains cloned into a LAI backbone. gp41 peptides were also recognized by sera. T cell responses to the multi-clade vaccine had enhanced cross-reactive CD4 T-cell proliferative responses, but diminished gamma IFN CD8 T-cell responses. Keywords review, vaccine antigen design

- This review summarizes neutralizing epitopes on Env and their use as vaccine antigens. Most antibodies are not neutralizing, and while some antibodies directed to conserved domains can neutralize the virus, these are generally poorly immunogenic. Variable loops do not elicit much cross-reactive neutralization, although the stem regions of these loops are more conserved so may have some promise. Polyclonal pooled sera from infected people can generally neutralize heterologous virus, suggesting that neutralizing epitopes are yet to be discovered. Polyvalent vaccine design is considered key. - Vaccinations with either the subtype A V3 consensus in a Hepatitis B carrier protein, or a multiple antigen peptide (MAP) construct (mixotope) carrying some 5000 V3s representing the diversity of subtype A V3 loops, were compared. Each was combined with a C4 peptide spanning a region involved in CD4 binding. BALB/c mice were used for immunization. The consensus V3 gave higher and more cross-reactive responses than the mixotope. The mixotope response was restricted to the most conserved region of V3, while the consensus antibodies tended to recognize heptamers representing both sides and the tip of the loop. Antibodies against the C4 region were also raised. Cruz *et al.* [2004] (**variant cross-recognition or cross-neutralization**)

Keywords adjuvant comparison, vaccine-induced epitopes

- DNA prime vaccinations by intradermal or gene-gun delivery were given to neonatal macaques, with or without IL-12, followed by boosting with gp160, or else gp160 was given without the DNA prime. Many of the animals had neutralizing antibodies against autologous Env, and no CTL was detected prior to challenge after DNA inoculation. Autologous SHIV-vpu+ challenge was contained in 4/15 DNA prime-gp160 boost-vaccinated macaques and in 3/4 animals only receiving gp160. Six animals that contained virus were rechallenged with autologous virus, and the virus was rapidly cleared. After an additional challenge with heterologous pathogenic SHIV 89.6P, 4/6 maintained low or limited viral infection and normal CD4 counts. Two animals gave evidence of Gag specific CTL and proliferative responses after pathogenic SHIV challenge with 89.6P, with no other evidence of infection. - Vaccination of macaques with SF162gp140 was compared with vaccination with SF162 deltaV2gp140. V1, V2, V3, CD4BS, C1 and C2 antibodies were elicited by the intact SF612, and the antibodies were able to neutralize some heterologous strains. Deletion of the V2 loop altered the response so that there was a higher ratio of CD4BS antibody made relative to V3 antibody, but did not increase overall amount of CD4BS antibodies. Antibodies against C5 were also elicited by the deltaV2 construct. Overall, the deltaV2 construct was better able to raise antibodies that could cross-neutralize heterologous strains. Using a cleaved versus fused form of gp120 altered the ratio of C1 to C5 antibodies raised, with more C5 response to the fused form. - gp160-specific Abs were detected in platelet elutates from HIV-1 infected patients with immunologic thrombocytopenia purpura (ITP).One patient with high titer anti-gp160/120 Abs had IgG that bound specifically to both gp160/120 and to platelet GPIIb/IIIa, apparent molecular mimicry. The cross-reactive epitope on gp120 has not been defined, however a conformational aspect and/or glycosylation is likely to be involved. Bettaieb *et al.* [1992] (**mimics**)

- HIV-1 fusion complexes were prepared from cell lines expressing R5 HIV-1 gp120/gp41 and CD4-CCR5. Fusion complexes were prepared at different temperatures (21, 30 or 37 degrees C) with different fixative combinations, and used to immunize mice. Complexes prepared at 37 degrees were the most immunogenic, suggesting that fixation of multiple conformation intermediates may by helpful. Neutralizing Abs were raised against both R5 (strain BaL) and X4 (strain 213) viruses. Zipeto *et al.* [2005] (**co-receptor**, **vaccine antigen design**)

- Four consensus B Env constructs: full length gp160, uncleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective uncleaved version mediated infection using the CCR5 co-receptor. DNA vaccinations of the four constructs were compared to two wildtype B clade isolates, CAAN5342 and WITO4160. The binding antibody titers elicited by the consensus proteins were 20 to 40 fold higher than to the two wildtype strains. ConB gp145 emerged as the immunogen with the greatest breadth and magnitude of responses, WITO4160 the worst. Con B gp145 and gp160 elicted significantly more potent antibodies than the wild type vaccines against a panel of easier to neutralize tier 1 viruses, but limited neutralization of tier 2 viruses was observed with any of the immunogens. Keywords acute/early infection, antibody interactions, autologous responses, neutralization, variant cross-recognition or cross-neutralization

- This study of 14 individuals infected with subtype C HIV-1 showed that they developed a potent autologous NAb response between 3 and 12 months of infection. The magnitude of this response was associated with shorter V1-V5 envelope lengths and fewer glycosylation sites. Very limited heterologous viral neutralization was observed during the first year of infection. Abs to CD4i epitopes were found in most patients, while MPER antibodies developed later and in fewer individuals. Abs to CD4i or MPER did not confer neutralization breadth to heterologous virus. These results suggest that strain-specific Abs target areas distinct from those targeted by cross-neutralizing Abs. Keywords antibody binding site definition and exposure, neutralization, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- A group M consensus envelope gene (CON-S) was designed that was central to the M group and a consensus of the consensus sequences of the major clades. The gp140δCFI protein of this virus and gp140CFI and gp140CF proteins of CON6 and other WT viruses were expressed in recombinant vaccinia viruses. The CON-S was shown to induce cross-subtype neutralizing Abs in immunized guinea pigs with greater breadth (neutralizing most A, B and C clade isolates) and titer than the WT proteins. Much of the neutralizing activity induced by CON-S Env was absorbed by the CON-S V3 peptide. - The potential of HIV-1 acute infection Env glycomutants designed from 3D model to elicit neutralizing responses in rabbits was evaluated. Specific potential N-linked glycosylation sites were removed that rendered an Env more neutralization susceptible; these forms were then tested as immunogens in rabbits. It was shown that the protein boosts induced a strong Env-specific antibody response mainly directed against conformational epitopes. The Ab avidity increased constantly through the immunizations. For one glycomutant, the neutralization breadth was increased compared to WT. The WT used as the basis for this study was isolated from a homosexual individual with acute B clade infection. - Resistance to NAb in plasma from resistant donor-sensitive recipient pairs was correlated with sequence divergence in the gp120 V1-V4 region and to acquisition of length in the gp120 hypervariable domains in donor plasma. Association between nine amino acid positions in V1-V4 and Ab resistance was found, where five of the positions were located in the alpha-2 helix of the gp120 outer domain. These same 5 positions were found to be under positive selection pressure in subtype C sequences from Los Alamos Sequence Database. However, exchange of the alpha-2 helix between resistant donor and sensitive recipient Envs did not alter NAb phenotype, suggesting that positions within alpha-2 helix must be linked to other domains of Env to utilize NAb escape. Keywords acute/early infection, autologous responses, neutralization, subtype comparisons, variant cross-recognition or cross-neutralization

- This study examined the course and magnitude of autologous neutralizing Ab response during early HIV-1 infection in patients infected with subtypes B and C. It was found that subtype C infected individuals had a 3.5-fold higher IC50-titers of NAbs in plasma than subtype B infected individuals. The higher NAb titers were associated with the significantly shorter length of the HIV-1 V1-V4 regions of subtype C virus. However, despite the potency of the subtype C NAb response, the response was not found to be directed against the cross-neutralizing epitopes. The intrasubtype cross-neutralizing activity was much more prevalent in subtype B HIV-1. This indicates existence of clade-specific differences of Env-associated immunogenicity or neutralization susceptibility. - Mice were vaccinated with high or low dose DNA plasmids expressing Envgp120, Envgp120-mC3d, Envgp140, or Envgp40-mC3d, and boosted with trimeric Envgp140. Mice vaccinated with high dose DNA followed by trimer Envgp140 boost developed highest anti-Env titers and the broadest number of IgG isotypes. However, Envgp140 trimers did not appear to elicit higher titers of Abs that recognized conformational Env epitopes compared to Envgp120 monomers. Mice vaccinated with C3d fused envelopes had Abs with highest avidity, and Envgp140-mC3d was shown to elicit slightly higher neutralization titers for ADA and YU-2 isoaltes than Envgp120. These results indicate that although gp140 trimers are slightly more efficient at eliciting NAb than gp120, the neutralizing ability does not correlate with the induction of conformational antibodies. - Complement induced lysis activity against autologous virus and a heterologous primary isolate, HIV-1 JR-FL, was shown to be higher in patients in the chronic stage of infection than in patients in the acute stage. However, plasma viral loads during the acute stage of infection were inversely correlated with the autologous complement lysis activity, suggesting that the antibody-mediated virion lysis is effective early in the course of infection. Titers of Abs to gp120 and gp41 increased with increased lysis activity, indicating that early anti-Env responses mediate complement lysis. No association between neutralization and complement lysis activity was observed, suggesting that complement lysis is predominantly caused by non-neutralizing Abs. Keywords ADCC, complement, neutralization, vaccine antigen design

- Rabbits immunized with HXB2 derived gp140deltaCFI plasmid DNA with the most divergent region replaced with the corresponding sequence of 89.6 Env, and boosted with gp140deltaCFI protein developed Ab resonses. The Ab neutralizing activity was detected against homologous 89.6 virus while other HIV-1 isolates were neutralized less effectively. Mice immunized with the gp140deltaCFI construct developed IgM responses with no effect of the presence or absence of IL-15 and IL-21 in the immunization assay. In constrast, coimmunization with IL-15 and IL-21 augmented Env-specific IgG responses, where IL-15 augmented IgG2a and IgG2b responses and IL-21 augmented Env-specific IgG1 Abs. None of the cytokines affected IgG3 Ab responses. The use of IL-15 and IL-21 was also shown to increase Ab-dependent cellular cytotoxicity and complement-dependent lysis of Env-expressing target cells. Species (Isotype) hamster (IgG)
References Azizi *et al.* 2006
Keywords neutralization, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- Three groups of hamsters were immunized with gp120 protein cloned from subtype B infected individuals, where group 1 received gp120 from one patient, group 2 from 4 patients and group 3 from all 14 patients. Group 3 (polyvalent vaccine) plasma showed higher IgG Ab titer to HIV-1 subtype B isolates MN and SF162 than the other groups, but not to subtypes C and A/E. The polyvalent vaccine showed similar neutralizing activity against the MN strain as the 4-protein group. All vaccines failed to neutralize other primary HIV-1 isolates. Species (Isotype) rabbit
References Beddows *et al.* 2007
Keywords neutralization, vaccine antigen design, variant cross-recognition or cross-neutralization

- Rabbits were immunized with either monomeric gp120, trimeric cleavage-defective gp140 or disulfide-stabilized soluble trimeric gp140 with both DNA-prime protein boost and protein prime protein boost immunization formats. All three proteins were shown to induce NAbs against neutralization sensitive strains with limited breadth of activity. Disulfide-stabilized protein most frequently elicited NAbs against the homologous neutralization resistant strain. These Abs were shown not to be directed at the V3 region but targeted other gp120 and non-gp120 epitopes. Beddows *et al.* [2007]

- In order to determine if the form and presentation of envelope influence elicited immunity, mice were immunized with either soluble monomeric Env-gp120 or trimeric Env-gp140, or trimeric membrane-retained Env in form of VLPs. It was shown that both VLPs and soluble Envs elicited anti-Env serum Abs. However, only VLP immunized mice elicited high mucosal anti-Env Abs and Abs that blocked viral infection of neutralization-resistant viruses. In addition, VLPs elicited Abs that recognized a broader number of Env-specific peptides at higher titers. - Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates. All gp140 immunogens elicited stronger anti-gp120 than anti-gp41 Abs and potent homologous NAbs primarily targeting the V1 loop. Heterologous NAb responses were weak and narrow, or non-existent. Responses from the SHIV-infected macaque and human sera generated similar amounts of anti-gp120 and anti-gp41 Abs, and heterologous NAbs which did not target the V1 loop. A gradual increase in Abs to conformational epitopes was observed in the SHIV-infected macaque, while this was not as evident in the responses to gp140 constructs. References Zolla-Pazner 2005
Keywords antibody binding site definition and exposure, review, variant cross-recognition or cross-neutralization

- This review summarizes data that indicate that the V3 region of HIV-1 may be an epitope to target for the induction of protective Abs. Data shows that the V3 region can induce broadly-reactive, cross-neutralizing Abs, that it is partially exposed during various stages of the infectious process, and that it is immunogenic. As such, it is suggested that it should constitute a prominent target of the immune response induced with an HIV vaccine. Keywords antibody binding site definition and exposure, neutralization, subtype comparisons

- A T-cell line adapted strain (TCLA) of CRF01_AE primary isolate DA5 (PI) was more neutralization sensitive to MAbs specific to V3, CD4bs and to CD4i epitope than the primary isolate. Mutant virus derived from the PI strain that lacked N-linked glycosylation at position 197 in the C2 region of gp120 was more sensitive to neutralization by pooled sera and MAbs then the PI strain. Deglycosylated subtype B mutants at positions 197 and 234 were significantly more sensitive to neutralization by pooled sera and F105 MAb than the parental strain. In contrast, the mutant at position 295 in V3 did not show any increase in neutralization sensitivity, although glycosylation at this site has been found to provide protection against NAbs in subtype B. This indicates that CRF01_AE viruses can use different N-linked glycosylation sites than subtype B for the protection of their neutralizing epitopes. - Multi-envelope vaccine using three different delivery systems was used to immunize rhesus macaques. The vaccine elicited humoral immune responses of wide breadth in all animals, including both binding and neutralizing Abs. The elicited NAbs showed significant activities towards a variety of heterologous viruses, with exception toward viruses that were hard to neutralize in general. All animals became infected upon challenge with the heterologous SHIV 89.6, but the vaccinated animals experienced significantly lower virus titers and better CD4 T-cell control. HIV-1-specific Ab responses were far superior post-challenge in the vaccinated group compared to the pre-challenge responses in this group, and compared to control animals. - Guinea pigs were immunized with monomeric gp120 or trimeric gp140 proteins in adjuvants Ribi or GlaxoSmithKline (GSK) family of adjuvants AS01B, AS02A and AS03. gp140 elicited higher-titer neutralizing Abs against homo- and heterologous isolates than gp120. GSK adjuvants induced higher level of neutralizing Abs than Ribi for both gp120 and gp140. Homologous neutralization activity of gp120 was V1-focused while gp140-immunized sera was not and neutralized heterologous isolates more eficiently. - Mice were immunized with a fusion protein consisting of cholera toxin B (CTB) and the MPR of gp41 ectodomain peptide in the presence or absence of adjuvant and through different prime-boost routes. It was shown that mucosal priming with CT adjuvant followed by systemic boosting induced best response of vaginal IgA and serum IgG Abs specific to MPR-peptide. Systemic priming with boost induced strong serum anti-MPR IgG responses but was less effective in inducing secretory anti-MPR IgA. Co-immunization with CT mucosal adjuvant resulted in higher proportion of IgG2a while its absence skewed the Ab responses towards IgG1. - Guinea pigs were immunized with chimeric immunogens prepared from different clades of HIV-1 with modifications in variable regions. It was observed that the V3-specific neutralization activity induced by a clade B immunogen was limited to clade B viruses and was blocked by clade B V3 peptide but not by clade A and C peptides. The V3 region of clade C was shown to elicit Abs that neutralized some clade A, B and C isolates, suggesting that immunization with clade C V3 might induce more cross-reactive Abs than with subtype B. A V1-specific immune response was described that might be partially responsible for strain-specific neutralization responses. - Macaques were immunized with either CD4, gp120, cross-linked gp120-human CD4 complex (gp120-CD4 XL), and with single chain complex containing gp120 rhesus macaque CD4 domains 1 and 2 (rhFLSC). Animals immunized with rhFLSC showed accelerated decline and clearance of plasma viremia, and absence of viremia in tissue. The control of viral replication correlated with relatively stronger anti-CD4i epitope responses. When these animals were challenged with SHIV162P3, the anti-CD4 epitope responses were boosted. Animals immunized with gp120-CD4 XL raised anti-CD4 epitope responses less efficiently then rhFLSC animals, and failed to control infection. Neutralization activity against HIV731A/V434M was detected in three out of four rhFLSC immunized macaques, and in two out of four gp120-CD4 XL immunized macaques. The control of infection did not correlate with neutralization activity. DeVico *et al.* [2007] (**neutralization**, **vaccine antigen design**, **binding affinity**)

- V3 loop deletions were introduced into three different primary HIV-1 strains: R3A, DH12, and TYBE. The deletions included: ΔV3(12,12) containing the first and the last 12 residues of the V3 loop, ΔV3(9,9) containing first and last 9 residues, and ΔV3(6,6) ontaining first and last 6 residues. Only HIV-1 R3A ΔV3(9,9) was able to support cell fusion. Passaging of this virus resulted in a virus strain (TA1) that replicated with wildtype kinetics, and that acquired several adaptive changes in gp120 and gp41 while retaining the V3 loop truncation. TA1 was efficiently neutralized by four different HIV positive human sera, in contrast to R3A, which was neutralized inefficiently. Virions bearing a V1/V2 truncation were neutralized by three out of four human sera. Laakso *et al.* [2007] (**neutralization**)

Keywords co-receptor, neutralization

- The neutralization profile of early R5, intermediate R5X4, and late X4 viruses from a rhesus macaque infected with SHIV-SF162P3N was assessed. The early R5 and the intermediate R5X4 viruses were equally sensitive to neutralization with Abs present in the R5 SHIV serum. The parental R5 virus was resistant to neutralization with serum Abs from an X4 SHIV-infected macaque, while the R5X4 virus was efficiently neutralized, and the final X4 virus was the most neutralization sensitive of all. The dual-tropic R5X4 viruses from the macaque were found to be temporal, evolutionary, functional, and antigenic intermediates in the pathway to coreceptor switch in rhesus macaques. Keywords acute/early infection, antibody generation, autologous responses, complement

- To investigate B-cell responses immediately following HIV-1 transmission, env-specific Ab responses to autologous and consensus Envs in plasma donors were determined. The first detectable B-cell response was in the form of Ab-virus immune complexes 8 days after T0 (plasma virus detection), while the first free plasma IgG anti-HIV-1 Ab was to gp41 and appeared 13 days after T0. gp120-specific Abs appeared 28 days after T0 and were mainly directed to the V3 loop. Abs against p24 and p55 appeared 18 days after T0, Abs against p66 appeared 21 days after T0, and Abs against p17 and p31 appeared 33 and 53 days after T0, respectively. Abs that did not appear within 40 days after T0 were anti-MPER, CD4bs, and CD4i Abs. As with IgG responses, the first IgM Ab targeted gp41 and appeared 13 days after T0. IgM anti-gp41 was detected at the same time as IgG and IgA anti-gp41 Abs. IgM responses were transient and decayed over a period of 20 to 40 days while IgG responses rose over the same period. Anti-gp41 Env Abs were also found to activate complement. In a cohort of patients from Trinidad and Tobago (subtype B), CD41, CD4bs, and cluster II MPER Abs arose 5-10 weeks postenrollment into the acute infection study. Tier 1 neutralizing Abs appeared 8 weeks after infection and were primarily V3-directed. Autologous neutralizing Abs arose 32 weeks after infection in the clade B cohort, and 19 weeks after infection in a subtype C patient cohort. The early Abs were shown to have little functional consequence for the control of viremia. References Granados-Gonzalez *et al.* 2008

- The study evaluated the influence of glycosylation within the V1/V2 domain on antibody recognition. Recombinant proteins, demonstrated to be folded in native conformation, were produced following transfection of CHO cells by plasmids expressing V1/V2 domains from primary isolates of different clades. From a cohort of HIV-seropositive patients, serum IgA and IgG and SIgA antibodies with anti-V1/V2 specificity demosntrated a good recognition of these recombinant proteins that were dependent on glycosylation. Declycosylation of the recombinant proteins increased the reactivity of the serum IgG to the clade A and C but not to clade B V1/V2 domain. Granados-Gonzalez *et al.* [2008]

- Sera from guinea pigs immunized with subtype B or C Envs containing a deletion of the V1V2 loop and two small deletions on both arms of the V3 stem were previously shown to contain high amounts of anti-V3 neutralizing Abs. To test whether the conformation change of Env induced by CD4 affects the breadth and the neutralization potency of these anti-V3 Abs, the sera were tested in the presence or absence of sCD4 in neutralization of a panel of 12 subtype B and 12 subtype C Env-pseudoviruses. Without sCD4, subtype B- and C-immunized sera neutralized fewer HIV isolates than with sCD4 present, indicating that neutralization resistance of some viruses to anti-V3 Abs is due to a lack of exposure of the V3 loop. Neutralization of JRFL, ADA, and YU2 isolates by the sera increased with increased dose of sCD4. - Mice were immunized with three constructs of the outer domain (OD) of gp120 of subtype C, fused with Fc. All the OD constructs were immunogenic in the Fc-bound format, but the overall reactivity was severely reduced in sera from mice immunized with OD(DL3)-Fc (has 29 residues from the centre of the V3 loop removed) and with OD(2F5)-Fc (has the same deletion reconstructed to contain the sequence of 2F5 epitope), compared to the parental OD-Fc molecule. Despite the low titer response of the OD(DL3)-Fc and OD(2F5)-Fc, the fine specificity of polyclonal sera response showed that much of the OD immunogenicity resided in the V3 loop. The polyclonal sera from the immunized mice failed to neutralize both subtype C CN54 and subtype B MN isolates, and showed only a marginal ability to prevent entry of the highly sensitive 93MW965.26 isolate. - Requirements for elicitation of CD4i Abs were examined by immunizing non-primate monkeys, rabbits, and human-CD4 transgenic (huCD4) rabbits with trimeric gp140. Similar HIV-1 neutralization breadth was elicited in both monkeys and rabbits, however, CD4i Abs were elicited only in monkeys and huCD4-rabbits, indicating requirement of primate CD4 presence for the elicitation of CD4i Abs. This was confirmed by the detection of high-titer CD4i Abs in all sera derived from human volunteers inoculated with recombinant gp120. The results also indicate that the naive B-cell receptor does not recognize the gp120 co-receptor site in the absence of CD4. Forsell *et al.* [2008] (**neutralization**, **vaccine antigen design**)

- Rabbits immunized with CTB-MPR649-684 (cholera toxin subunit B and residues 649-684 of gp41 MPER region) and boosted with a second MPR649-684-based immunogen elicited a productive anti-MPR649-684 Ab response. The majority of the raised Abs targeted the N-terminal portion of the MPR peptide, away from the 2F5 and 4E10 epitopes, and were not effective in neutralizing infection of CD4+ cells. These Abs, however, strongly blocked the epithelial transcytosis of a primary subtype B HIV-1 isolate, indicating that non-neutralizing Abs may play a role in stopping mucosal transmission and infection of target cells. - For assessment of gp41 immunogenic properties, five soluble GST-fusion proteins encompassing C-terminal 30, 64, 100, 142, or 172 (full-length) amino acids of gp41 ectodomain were generated from M group consensus env sequence. The proteins were recognized by polyclonal HIV-Ig from pooled patient sera. Plasma samples from 44 HIV-1-infected individuals were also assessed separately and showed great variation in Ab reactivity against GST-gp41-100, -64, and -30 fragments, both in terms the magnitude and binding patterns. The strongest Ab responses were detected against the 100aa fragment. Patients considered as slow progressors generally exibited larger Ab reactivity against the 30aa fragment, indicating that these Abs target MPER region and exhibit 2F5- and 4E10-like properties. Plasma from these patients also exhibited broader and more potent neutralizing activity against several HIV-1 isolates. Plasma from a patient with the strongest neutralizing activity also neutralized clade A, B, and C viruses. Plasma from 8 of 44 patients had 2F5-like Abs, plasma from 6 patients had Z13-like Abs, and plasma from 4 patients had 4E10-like Abs, indicating that patients that mount Abs against epitopes that are near, or overlapping with, 2F5 or 4E10, may not be as rare as previously thought. - In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by plasma NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by pooled human sera, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. A subset of sera neutralized the CCR5 inhibitor-resistant viruses more potently than the two sensitive viruses. 6/16 sera neutralized D1/85.16 at higher than expected titers, while only 2/16 sera did so against the CC101.19 mutant. This suggests that CCR5 inhibitor-resistant viruses are likely to be somewhat more sensitive to neutralization than their parental viruses. - Quaternary structure of gp41 helical domains N-HR and C-HR was mimicked by 3α N-HR and 3α C-HR mimetic proteins consisting of covalently linked trimeric coiled-coil bundle, which is a truncated version of the gp41 prehairpin. The 3α mimetics were immunogenic and elicited Abs in guinea pigs specific for gp41. The sera from immunized animals neutralized viral R5 and X4-tropic viruses at 31.5 degrees C, indicating that the elicited Abs bind to a transition state between pre- and postfusion of the six-helix bundle. Addition of a Th epitope to the 3α mimetics did not increase the quantity of Ab produced, but did increase the inhibitory activity of the sera. - DNA prime-protein boost regimen was shown to be more effective than a protein-alone vaccination in inducing Abs targeting the V3 loop and the CD4 binding site (CD4bs). High-level V3 Abs were responsible for neutralizing activities against the neutralization sensitive isolate SF162, while the CD4bs Abs were responsible for the neutralizing activity against more resistant HIV primary isolates. Sera from rabbits immunized with DNA prime-protein boost regimen also recognized a region at the junction of the V5 and C5, a region that is highly conserved among different HIV clades, while sera from protein-alone immunized rabbits did not. Rabbit immune sera showed different binding preferences for subdomains of the V3 loops from gp120 from different clades, indicating that the V3 loops of different HIV clades are oriented differently and elicit different Ab specificities. Keywords neutralization, vaccine antigen design, variant cross-recognition or cross-neutralization

- Mice immunized with gp120/anti CD4bs mAb complexes produced higher titers of gp120-specific serum IgG1 and IgA than mice immunized with other gp120/mAb complexes or gp120 alone. Immunization with gp120/anti-CD4bs mAb complexes enhanced the Ab response to V3, while responses to other gp120 regions were comparable. Abs elicited by gp120/anti-CD4bs mAb complex immunization reacted preferentially with homologous V3 peptide, and sera from immunized mice potently neutralized homologous, but not heterologous, HIV-1 isolates. The results indicate that the gp120/anti-CD4bs mAb complexes elicit the production of V3-specific neutralizing Abs, but that those Abs are skewed towards V3 epitopes not shared among different HIV-1 isolates. Keywords kinetics, vaccine-induced epitopes

- To test inhibitory significance of anti CD4bs Abs in vivo, mice were immunized with recombinant envelope proteins with or without CD4-binding activity. CD4bs Abs were generated only in animals immunized with CD4bs+ Env, and their presence was associated with with lower levels of envelope-specific lymphoploriferation. In addition, mice were immunized with gp120 in the presence of anti-CD4bs Ab or anti-C5 Ab. Mice immunized with gp120/anti-CD4 mAb complex showed lower levels of lymphoproliferation, indicating that anti-CD4bs Abs supress the induction of CD4 T cell responses in vivo. However, mice immunized with gp120/anti-CD4bs Ab displayed faster kinetics and higher levels of gp120-specific serum IgG and IgA, but not IgM, indicating that immunization with gp120 in the presence of anti-CD4 Ab alters the immunogenicity of gp120 such that the immune response is dominated by anti-gp120 IgG. Keywords antibody binding site definition and exposure

- Rabbits were immunized with purified recombinant protein LLP1-2 (lentivirus lytic peptide of the gp41 cytoplasmic tail region including two α-helical domains LLP1 and LLP2) or with LLP2 peptide alone. LLP2-specific IgG predominated over the LLP1-specific IgG in the LLP1-2 immunized animals. Anti-LLP1-2 and anti-LLP2 IgGs recognized LLP1-2 and LLP2 but did not react with gp41, nor with peptides N36 and C34 or with the 6-HB formed by N36/C34. Both LLP1-2 and LLP2-specific IgGs, but not LLP1-specific IgGs, bound with the effector cells in the presence of target cells at 31.4 degrees C, but not at 37 degrees C. These results suggest that LLP2, but not LLP1 domain, may be exposed on the surface of the effector cell during its interaction with the target cell for cell-to-cell fusion. Furthermore, both LLP1-2 and LLP2-specific IgGs showed potent inhibitory activity against Env-mediated syncytium formation, indicating that binding of the Abs to the LLP2 domain interferes with gp41 CT-mediated cell-cell fusion. These results indicate that the LLP2 domain, which is located inside the viral membrane, is transiently exposed on the membrane surface during the fusion process. - A new high throughput method was developed for neutralization analyses of HIV-1 env genes by adding cytomegalovirus (CMV) immediate enhancer/promoter to the 5' end of the HIV-1 rev/env gene PCR products. The PCR method eliminates cloning, transformation, and plasmid DNA preparation steps in the generation of HIV-1 pseudovirions and allows for sufficient amounts of pseudovirions to be obtained for a large number of neutralization assays. Pseudovirions generated with the PCR method showed similar sensitivity to six HIV-1 positive sera, indicating that the neutralization properties are not altered by the new method. Keywords neutralization, review, variant cross-recognition or cross-neutralization

- This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, data on modulation of a virion's susceptibility to Ab-mediated neutralization is summarized. Immunogen vaccine
Vector/Type: Venezuelan equine encephalitis virus (VEE) *Strain:* B clade *HIV component:* gp160
Species (Isotype) mouse (IgG1, IgG2a)
References Ljungberg *et al.* 2007
Keywords vaccine antigen design

- Mice immunized with Venezuelan equine encephalitis (VEE) DNA encoding HIV-1 gp160 had a significantly increased Ab responses than mice immunized with a conventional DNA vaccine. The Ab subclasses revealed a Th1-type response. Using VEE vaccine as a prime and a VRP (VEE replicon particle) as a boost induced increasing humoral immunity compared to VEE immunization only. In addition, immunization with VEE DNA did not induce any anti-VRP neutralizing Abs. Only a few sera from immunized mice were able to neutralize HIV-1. Keywords neutralization, vaccine antigen design

- Mice immunized with E-PND, a peptide corresponding HIV gp120 residues 306-328 with 4 eletrophilic phosphonate diester groups, developed polyclonal Abs that formed complexes with intact virions and were poorly or not at all dissociable. Sera from mice immunized with E-PND were able to neutralize HIV MN with 44-272-fold greater potency than sera from mice immunized with the same peptide but without the eletrophilic phosphonate diester groups. None of the sera neutralized HIV subtype C. Analyses confirmed presence of anti-E-PND Abs with increased nucleophilic reactivity and their importance in prolonging immune complex longevity. These results indicate that inclusion of eletrophilic phosphonate diester groups in the immunogenic peptide may increase Ab neutralization potency. Immunogen vaccine
Vector/Type: virus-like particle (VLP) *Strain:* B clade 89.6 *HIV component:* Env
Species (Isotype) mouse (IgG, IgG1, IgG2a, IgG2b, IgG3)
Ab Type gp120 V3
References Quan *et al.* 2007
Keywords neutralization, vaccine antigen design

- Mice were immunized with SHIV virus like particles (VLPs) containing mutant HIV Env with reduced glycosylation (3G), V1V2 deletions (dV1V2), or both (3G-dV2-1G). Mice immunized with 3G-dV2-1G showed the highest level of IgG binding to HIV Env. IgG1, IgG2a, IgG2b, IgG3 and IgA were found in all immunized mice. Levels of V3 binding Abs were significantly higher in mice immunized with dV1V2. The highest neutralization activity against the homologous HIV 89.6 strain was found in sera from mice immunized with 3G, while the highest neutralizing activity against the heterologous YU2 and IIIB strains was found in sera from mice immunized with 3G-dV2-1G vaccine. These results indicate that immunizations with VLPs can induce neutralizing activity against homologous as well as heterologous strains, which can be increased by V1V2 deletions or deglycosylations. - Subtype C HIV-1 from four heterosexually infected pairs was cloned and sequenced. The donor and the recipient Envs were sensitive to autologous neutralization by contemporaneous plasma from the donors. Chimeric Envs were constructed where the V1V2 domains from the neutralization sensitive recipient Envs were replaced with donor V1V2. The neutralization sensitivity of the Envs was regulated by V1V2 domain length but also glycosylation, primary sequences, and V1V2-independent mechanisms. One residue was found to be associated with neutralization sensitivity of Env, Lys at position 309, where the Env became six-fold less sensitive to NAb when this residue was changed to Glu. Keywords antibody binding site definition and exposure, antibody generation, rate of progression, variant cross-recognition or cross-neutralization

- T26: T26 was found to predominantly bind to oligomeric gp41 and not to monomeric gp41. Binding of this Ab to H9/IIIB-infected cells gave a weak signal which was slightly increased by sCD4 pretreatment. Binding to H9/MN-infected cells gave no signal regardless of sCD4 pretreatment. Sera from both long-term survivors (LTS) and AIDS patients inhibited binding of T26 to H9/IIIB-infected cells, however, sera from the AIDS patients inhibited T26 more efficiently than the sera from LTS. Usami *et al.* [2005] (**antibody binding site definition and exposure**, **rate of progression**)
- T26: Mab is restricted in its binding to gp41 of the LAI isolate and not to gp41 of the MN, Ada and RF isolates. Antibody specificity may be determined by LAI residues D637E, N641D and H648Y. T26 binds to the N-terminal half of the C helix (aa630-680) of the LAI envelope, specifically targeting a confomational epitope within the six-helix bundle of gp41. Addition of the C-helical peptide inhibitor from LAI (T26 reactive) rescued the binding activity of MAb T26 to cell-surface expressed RF envelope (T26 non-reactive) triggered with sCD4 or cell-surface expressed receptors in a surface immunoprecipitation assay. This supports that C-peptide entry inhibitors bind to the gp41 N-helical coiled-coil, disrupting native six-helix bundles. Kilgore *et al.* [2003] (**antibody binding site definition and exposure**)
- T26: T26 was raised against the gp140 tetramer, binds to gp41 and is a highly strain specific. Earl *et al.* [1997] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- T26: A panel of 138 MAb raised against different forms of soluble Env. Earl *et al.* [1994] (**antibody generation**)

- 212A: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 212A. Pantophlet *et al.* [2004] (**vaccine antigen design**)

- 212A: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 212A: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 212A: Does not compete with binding of MAb generated in response to gp120-CD4 complex, CG10. Sullivan *et al.* [1998b]
- 212A: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 212A bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997]
- 212A: Does not neutralize TCLA strains or primary isolates. Parren *et al.* [1997b]
- 212A: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids are deleted. Wyatt *et al.* [1997]
- 212A: Binding enhanced by anti-V3 MAb 5G11 – reciprocal inhibition with anti-C1 MAbs. Moore & Sodroski [1996]
- 212A: Mutations that inhibit binding: C1 (45 W/S) and V5 (463 N/D) – and enhance binding: V2 (179/180 LD/DL) and C5 (495 G/K). Moore *et al.* [1994d]

- 522-149: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 522-149. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 522-149: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 522-149: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C1-binding Fab that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- 522-149: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 522-149: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 522-149: Binding is enhanced by C5 antibodies M91 and 1C1 – mutual binding-inhibition with anti-C1 antibody 133/290 – binding is destroyed by a W/L (position 61, LAI) gp120 amino acid substitution – other C1 antibodies enhance binding to gp120. Moore & Sodroski [1996]
- 522-149: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]

- MAG 45: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an alternative to using bone marrow for generating libraries. MAG 45 was among a set of Abs used for competition studies to define the binding sites of the newly isolated MAbs, representing a MAb with a C1 epitope. Koefoed *et al.* [2005] (**antibody binding site definition and exposure**)
- MAG 45: Called #45 – a combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- MAG 45: Called #45 – binds to efficiently sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-50, are deleted. Wyatt *et al.* [1997]
- MAG 45: Reciprocal binding inhibition with anti-C1-C5 and anti-C1-C4 discontinuous MAbs – binding enhanced by anti-V3 5G11 – inhibits binding of anti-CD4 binding site MAbs. Moore & Sodroski [1996]
- MAG 45: Only observed amino acid substitution that reduces binding: 88 N/P – does not bind to C1 region 20 mer peptides, tentative classification conformationally sensitive anti-C1 MAb. Kang *et al.* [1994]

- P35: called p35. scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of

B Cell

the V1/V2 and V3 loops restrict CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C1-binding Fab with a discontinuous epitope that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)

- P35:Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-terminal, linear. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- T9 database comment: There are two HIV-Abs with the name T9, one binds to gp41, one to gp120.
- T9: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b – nor did it alter two gp41 MAbs, T9 and D61, inability to inhibit fusion. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
- T9: This antibody, along with 7 others (M10, D41, D54, T6, T4, T10 and T35), can block the linear murine MAb D61, and the human MAb 246-D, which both bind to the immunodominant region near the two Cys in gp41 – most of these antibodies are oligomer dependent – all of the MAbs are reactive with ten different HIV-1 strains – members of this competition group are blocked by sera from HIV-1 + individuals. Earl *et al.* [1997] (**antibody binding site definition and exposure**)
- T9: One of five MAbs (T4, T6, T9, T10 and T35) in a competition group that bind to a conformation-dependent epitope in gp41 and is oligomer specific – neutralizes IIIB and SF2. Broder *et al.* [1994] (**antibody generation**, **variant cross-recognition or cross-neutralization**)

- P7: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs and sCD4 were able to shift JR-FL trimers, In contrast, most non-neutralizing Fabs, P7 in particular, bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- P7: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. P7 was found to bind to nonfunctional monomers. Monomer binding did not correlate with neutralization, but it did correlate with virus capture. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**)
- p7: gp120 immobilized on solid phase by capture with sCD4 was used for selection of Fabs – three novel N-term Fabs were obtained that bind to similar epitopes, p7, p20, and p35 – a C1 W/S substitution at position 45 abolished binding, a Y/D at position 45 reduced binding, and C5 region substitutions 475 M/S and 493 P/K enhanced binding – compete with MAbs M85, M90 and 212A, but not M91 and G3-299. Ditzel *et al.* [1997] (**antibody generation**)
- p7: Does not neutralize TCLA strains or primary isolates. Parren *et al.* [1997b]

- 2/11c: Interactions of this Ab with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that 2/11c recognized the soluble monomer more efficiently than the soluble trimers and that treatment of the proteins with GA (cross-linking) further decreased the interactions of this Ab with the trimers to low levels, indicating that the access of the 2/11c epitope was affected by cross-linking of the trimers but not the monomer. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **binding affinity**)
- 211c: R-FL and YU2 HIV-1 strains were not neutralized by 211c. 211c and other non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins, while the neutralizing Abs (2G12 and IgG1b12) recognized both cleavage competent and cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. Abs able to neutralize lab-adapted isolates displayed enhanced viral entry at higher Ab concentrations, whereas Abs that cannot neutralize any virus, such as 211c, did not display such enhancement. Pancera & Wyatt [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 2/11c: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds decreased binding of 2/11c to the glycoprotein, indicating that the inter-S-S bonds contribute to the exposure of the 2/11c epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- 2/11c: Called 211/c. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate

B Cell

masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-terminus, discontinuous. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- 2/11c: Used as a negative control in a study of CD4i MAbs. Xiang *et al.* [2002a]
- 2/11c: Called 211/c – a panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998]
- 2/11c: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric env binding – 2/11c bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997]
- 2/11c: Called 2.11c – One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 50% neutralization could not be achieved at a maximal concentration of 67 mug/ml. Li *et al.* [1997]
- 2/11c: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-74, are deleted. Wyatt *et al.* [1997]
- 2/11c: Inhibits binding of anti-C1, -C5, -C4, -V3 and anti-CD4 binding site MAbs – induces binding of some anti-V2 and CD4i MAbs (48d and 17b) – similar reactivity pattern to A32, but less cross-reactive and lower affinity – A32 and 211/c are unique among known human and rodent MAbs. Moore & Sodroski [1996]
- 2/11c: Called 211c – does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]

- A32: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. A32 bound minimally, but comparably to both pseudoviruses, and A32 failed to inhibit infection by either pseudovirus. Dey *et al.* [2008] (**binding affinity**)
- A32: Macaques were immunized with either CD4, gp120, cross-linked gp120-human CD4 complex (gp120-CD4 XL), and with single chain complex containing gp120 rhesus macaque CD4 domains 1 and 2 (rhFLSC). Sera from the gp120-CD4 XL immunized animals showed highest competition titers, being able to block gp120-CD4 complex interactions with A32 more efficiently than sera from animals immunized with the three other proteins. DeVico *et al.* [2007] (**neutralization**)
- A32: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to A32 and other MAbs. Binding of A32 following CD4 also indicated presence of functionally relevant conformational changes of the proteins. Gao *et al.* [2007] (**antibody binding site definition and exposure**, **review**)
- A32: Addition of a glycosylation site at position V295N in three different subtype C envelope clones did not have any impact on binding of A32 to gp120, indicating that the mutation did not cause a substantial conformational change. Gray *et al.* [2007b] (**binding affinity**)
- A32: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**antibody binding site definition and exposure**, **enhancing activity**)

B Cell

- A32: This Ab was used in a microcantilever deflection assay to detect gp120 from solution. Deflection twice that of the baseline was detected upon specific binding of gp120 to cantilevers decorated on one side with A32. Lam *et al.* [2006] (**assay development**, **assay standardization/improvement**)
- A32: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. A32 was shown to bind specifically to all recombinant proteins except for the one derived from subtype C virus. It also bound specifically to the two subtype B gp120 proteins. The specific binding of A32 to CON-S indicated that its conformational epitope was intact. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- A32: Monomeric gp120 and trimeric gp140CF proteins synthesized from an artificial group M consensus Env gene (CON6) bound with high affinity to A32, indicating correct exposure of the A32 epitope. A32 induced conformational changes of gp120 and gp140CF required for binding of MAb 17b. Gao *et al.* [2005a] (**antibody binding site definition and exposure**, **kinetics**, **binding affinity**)
- A32: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- A32: A reverse capture assay was developed to asses what kind of human MAbs were produced in EBV B-cell transformation assays performed on PBMC sampled at different timepoints from three HIV-1 infected patients on HAART. The reverse capture assay was validated by the solid phase MAbs that could not capture biotin-MAbs of the same or overlapping specificity when reacted with patient virus envelope glycoproteins preincubated with or without sCD4. Reverse capture assay showed that the produced Abs from the patients were able to block binding of biotin-labeled A32, however the blocking was low, indicating presence of relatively few A32-like Abs. Robinson *et al.* [2005] (**antibody generation**, **assay development**, **HAART, ART**)
- A32: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V1/V2/V3 MAb 4KG2, C1-C4 MAb A32, C1-C5 MAb C11, and HIVIG all either did not bind or had significantly diminished binding to both antigen constructs. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- A32: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds decreased binding of A32 to the glycoprotein, indicating that the inter-S-S bonds contribute to the exposure of the A32 epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- A32: A32-rgp120 complexes opened up the CCR5 coreceptor binding site, but did not induce neutralizing antibodies with greater breadth among B subtype isolates than did uncomplexed rgp120 in vaccinated guinea pigs. Liao *et al.* [2004] (**vaccine antigen design**)
- A32: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including A32. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- A32: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- A32: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. A32 is described as having a C1-C4 discontinuous CD4i epitope, and had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- A32: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface – non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12 – the MAb 17b was sCD4 inducible on gp160deltaCT PL. Grundner *et al.* [2002] (**vaccine antigen design**)
- A32: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neu-

B Cell

tralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-terminal, discontinuous. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- A32: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002] (**antibody binding site definition and exposure**)
- A32: Using a cell-fusion system, it was found CD4i antibodies 17b, 48d, and CG10 reacted faintly with Env expressing HeLA cells even in the absence of sCD4 or CD4 expressing target cells. Reactivity increased after sCD4 addition, but not after CD4 expressing target cell addition, and binding was not increased at the cell-to-cell CD4-Env interface. This suggests the CD4i co-receptor binding domain is largely blocked at the cell-fusion interface, and so CD4i antibodies would not be able access this site and neutralize cell-mediated viral entry. However, CD4i MAbs 8F101 and A32, that bind outside the co-receptor domain, had a different pattern. They reacted after the formation of gp120-CD4-CXCR4 tri-complexes, so co-receptor interactions allowed exposure of their epitopes. Finnegan *et al.* [2001] (**antibody binding site definition and exposure**)
- A32: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000] (**vaccine antigen design**)
- A32: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**antibody binding site definition and exposure**)
- A32: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer. Binley *et al.* [1998] (**antibody binding site definition and exposure**)
- A32: Enhances binding of CD4i MAbs 17b and 48d, and a MAb generated in response to gp120-CD4 complex, CG10. Sullivan *et al.* [1998b] (**antibody interactions**)
- A32: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – A32 has a unique epitope involving mostly C2 but C1 and C4 contribute – six quite variable phage inserts were recognized, with a consensus of LPWYN – a central Trp was the most conserved element, consistent with W427 being an important residue for binding gp120. Boots *et al.* [1997] (**antibody binding site definition and exposure**, **mimotopes**)
- A32: Review. Burton & Montefiori [1997] (**review**)
- A32: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric env binding – A32 bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- A32: Does not neutralize TCLA strains or primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- A32: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- A32: Reciprocal inhibition of binding of anti-C1, -C5, -C4, -V3 and anti-CD4 binding site MAbs – induces binding of some anti-V2 and sCD4 inducible MAbs (48d and 17b) – very similar competition pattern between 2/11c, A32 and 211/c are unique among known human and rodent MAbs. Moore & Sodroski [1996] (**antibody binding site definition and exposure**, **antibody interactions**)
- A32: Does not neutralize JR-FL, or any strain strongly – partial inhibition of gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**co-receptor**)
- A32: Not neutralizing – binds domains that interact with gp41 – MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 and binding of A32 does not block this inhibition. Wu *et al.* [1996] (**antibody binding site definition and exposure**)

B Cell

- A32: Review: epitope is distinct from CD4BS MAbs, 48d and 17b, and 2G12. Moore & Ho [1995] (**antibody binding site definition and exposure**)
- A32: Epitope is better exposed upon CD4 binding to gp120 – binding of A32 enhances binding of 48d and 17b – studies using a V1/V2 deletion mutant demonstrated that enhanced binding of 48d in the presence sCD4 involves the V1/V2 loops, with more significant involvement of V2. Wyatt *et al.* [1995] (**antibody binding site definition and exposure**, **antibody interactions**)
- A32: Reacted with virtually every gp120 monomer of every clade tested, most conserved gp120 monomer epitope known. Moore *et al.* [1994b] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- C11: Two HIV-1 isolates, NL4-3 and KB9, were adapted to replicate in cells using the common marmoset receptors CD4 and CXCR4. The adaptation resulted in a small number of changes of env sequences in both isolates. None of the adaptation-associated changes in the HIV-1 env glycoproteins affected isolate recognition by the C11 Ab. Pacheco *et al.* [2008] (**antibody binding site definition and exposure**)
- C11: Yeast display was compared to phage display and shown to select all the scFv identified by phage display and additional novel antibodies. Biotinylated C11 and 2G12 were used to minimize selection of non-gp120 specific clones from the yeast displayed antibody library; these MAbs were used as they have unique epitopes with limited overlap with with most known epitopes. Bowley *et al.* [2007] (**assay standardization/improvement**)
- C11: Macaques were immunized with either CD4, gp120, cross-linked gp120-human CD4 complex (gp120-CD4 XL), and with single chain complex containing gp120 rhesus macaque CD4 domains 1 and 2 (rhFLSC). Sera from all the immunized animals were able to block gp120-CD4 complex interactions with C11 equally. DeVico *et al.* [2007] (**neutralization**)
- c11: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. c11 recognizes monomeric gp120. c11 was unable to neutralize or capture the VLPs studied, indicating that no forms of Env exist on the particles that resemble monomeric gp120 dissociated from gp41. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- C11: Viruses bearing inserted artificial epitopes of FLAG in the V4 region were as sensitive to neutralization by this Ab as the parental viruses. A clear relationship between neutralization potency and the affinity of the anti-FLAG antibody for its cognate epitope was observed. Yang *et al.* [2006] (**neutralization**, **binding affinity**)
- C11: Interactions of this Ab with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that C11 recognized the soluble monomer more efficiently than the soluble trimers and that treatment of the proteins with GA (cross-linking) further decreased the interactions of this Ab with the trimers to undetectable levels, indicating that the access of the C11 epitope was affected by cross-linking of the trimers but not the monomer. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **binding affinity**)
- C11: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. C11 has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- C11: A trimeric recombinant gp140 construct was developed for immunization studies. Its structural integrity was assessed by a panel of MAbs. The trimeric gp140 was poorly recognized by C11 compared to monomeric gp120, suggesting poor accessibility of the C11 epitope on the construct. Kim *et al.* [2005] (**antibody binding site definition and exposure**)
- C11: R-FL and YU2 HIV-1 strains were not neutralized by C11.C11 and other non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins, while the neutralizing Abs (2G12 and IgG1b12) recognized both cleavage competent and cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. Abs able

B Cell

to neutralize lab-adapted isolates displayed enhanced viral entry at higher Ab concentrations, whereas Abs that cannot neutralize any virus, such as C11, did not display such enhancement. Pancera & Wyatt [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)

- C11: A stable trimerization motif, GCN4, was appended to the C terminus of YU2gp120 to obtain stable gp120 trimers (gp120-GCN4). Each trimer subunit was capable of binding IgG1b12, indicating that they were at least 85% active. D457V mutation in the CD4 binding site resulted in a decreased affinity of the gp120-GCN4 for CD4 and for C11. Pancera *et al.* [2005] (**binding affinity**)
- C11: A reverse capture assay was developed to asses what kind of human MAbs were produced in EBV B-cell transformation assays performed on PBMC sampled at different timepoints from three HIV-1 infected patients on HAART. The reverse capture assay was validated by the solid phase MAbs that could not capture biotin-MAbs of the same or overlapping specificity when reacted with patient virus envelope glycoproteins preincubated with or without sCD4. Reverse capture assay showed that the produced Abs from the patients were able to block binding of biotin-labeled C11, indicating presence of C11-like Abs. Robinson *et al.* [2005] (**antibody generation**, **assay development**, **HAART, ART**)
- C11: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V1/V2/V3 MAb 4KG2, C1-C4 MAb A32, C1-C5 MAb C11, and HIVIG all either did not bind or had significantly diminished binding to both antigen constructs. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- C11: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds decreased binding of C11 to the glycoprotein, indicating that the inter-S-S bonds contribute to the exposure of the C11 epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- C11: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including C11. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- C11: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. C11 recognized most variants,some from each of the four individuals, by gp120 immunoprecipitation. Ohagen *et al.* [2003] (**brain/CSF**, **variant cross-recognition or cross-neutralization**)
- C11: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- C11: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. C11 was used as a negative control, as C11 binding did not alter binding of CD4-independent gp120 to CCR5, nor binding to CCR5-expressing Cf2Th cells. Raja *et al.* [2003] (**co-receptor**)
- C11: gp120 mutants were used to define the CXCR4 binding site using CXCR4 displayed on paramagnetic proteoliposomes (PMPLs) to reduce non-specific gp120 binding – basic residues in the V3 loop and the beta19 strand (RIKQ, positions 419-422) were involved, and deletion of the V1-V2 loops allowed CD4-independent CXCR4 binding – MAbs 17b (CD4i) and F105 (CD4BS) were used to study conformational changes in the mutants – C11 was used to detect gp120 binding to CXCR4 or CCR5 on PMPLs. Basmaciogullari *et al.* [2002] (**antibody binding site definition and exposure**)
- C11: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface – non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12 – the MAb 17b was sCD4 inducible on gp160deltaCT PL. Grundner *et al.* [2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- C11: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-299) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutraliz-

B Cell

ing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Authors describe the epitope as N-term and C-term binding. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- C11: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002] (**antibody binding site definition and exposure**)
- C11: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**vaccine antigen design**)
- C11: Does not compete with binding of MAb generated in response to gp120-CD4 complex, CG10. Sullivan *et al.* [1998b] (**antibody interactions**)
- C11: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – C11 bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- C11: Does not neutralize TCLA strains or primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- C11: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – partial re-exposure if sCD4 was bound – does not bind to HXBc2 gp120 if the 19 C-term amino acids are deleted. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- C11: Binding enhanced by anti-V3 MAb 5G11 – reciprocal inhibition with anti-C1 MAbs. Moore & Sodroski [1996] (**antibody interactions**)
- C11: Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**antibody binding site definition and exposure**)
- C11: Did not block ability of gp120-sCD4 complexes to inhibit MIP-1alpha binding – binds to gp41-binding domain. Wu *et al.* [1996] (**antibody binding site definition and exposure**)
- C11: Mutations that inhibit binding: C1 (45 W/S, 88 N/P) – V5 (463 N/D) – and C5 (491 I/F, 493 P/K and 495 G/K) and enhance binding: C1 (36 V/L) – V1-V2 (152/153 GE/SM) – and DeltaV1/V2/V3. Moore *et al.* [1994d] (**antibody binding site definition and exposure**)

Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, antibody sequence variable domain, assay standardization/improvement, binding affinity, neutralization, structure, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- 4KG5: Called 4KG.5. A direct comparison of phage and yeast display libraries was undertaken, and yeast display sampled the immune repertoire more fully. Previous results from panning a phage library generated from a long-term non-progressor were compared directly with a yeast library. As determined by sequencing, many MAbs were common to both, although the yeast library identifies unique scFv. 4KG5 was identified using both methods, and binds to a unique epitope that depends on V1, V2 and V3. Bowley *et al.* [2007] (**antibody binding site definition and exposure**, **antibody generation**, **binding affinity**, **antibody sequence variable domain**, **assay standardization/improvement**)
- 4KG5: This Ab was shown to infrequently neutralize cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors with and without broadly cross-reactive neutralizing antibodies. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4KG5: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. V1/V2/V3 MAb 4KG2, C1-C4 MAb A32, C1-C5 MAb C11, and HIVIG all either did not bind or had significantly diminished binding to both antigen constructs. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 4KG5: 4KG5, a single-chain Fv (scFv), reacts with a conformational epitope that is formed by the V1, V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. 4KG5 was derived from the serum of HIV-1 infected patient FDA2, who showed broad neutralizng activity, but is not itself neutralizing. Denaturation of gp120 abolished binding of 4KG5 and Fab b12. Addtionally, binding of 4KG5 was abrogated when any of the V1, V2 or V3 loops were deleted. Of a panel of Abs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished or abrogated binding: V2 loop MAbs (G3-4, G3-136), V3 loop MAbs (19b, 447-52D, hNM01, AH48, loop2, F425 B4e8, 694-88D), V3-C4 (G3-299, G3-42, G3-519, G3-537), CD4BS (b6, b3, F91, F105, 15e, L33, 1008-D, 654-30D, 559-64D, 1027-30D, Ia3, Ia7, FG39, Fbb14). MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1, V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. 4KG5 recognized HIV-1 envelope proteins derived from JR-FL, JR-CSF, BaL, ADA and R2, but not MN, DH123, HxB2, YU2, SF2 and 89.6. Binding of 4KG5 to different strains of HIV-1 env is probably due to sequence differences in V3 and C4, rather than V1 or V2. Zwick *et al.* [2003] (**antibody binding site definition and exposure**, **antibody generation**, **antibody interactions**, **variant cross-recognition or cross-neutralization**, **structure**)

- 23A: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. Schulke *et al.* [2002]
- 23A: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999]

B Cell

- 23A: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric env binding – 23A bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997]
- 23A: C5 binding MAb – does not inhibit gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- 23A: Called 2.3A – Did not block ability of gp120-sCD4 complexes to inhibit MIP-1alpha binding – binds to gp41-binding domain of gp120. Wu *et al.* [1996]

- D7324: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. The identity of gp120SF162 purified by miniCD4 method was confirmed by D7324-binding. D7324 was also used to normalize the concentration of gp120SF162 envelopes for comparison between the miniCD4 affinity chromatography and a reference method. Binding of D7324 to gp120SF162 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with intact D7324 epitope. Martin *et al.* [2008] (**assay development**, **binding affinity**)
- D7324: Binding of gp120 in the presence or absence of CD4, or in the presence of synthetic miniproteins with HIV-1 gp120 binding surface of the CD4 receptor incorporated, were evaluated using D7324 Ab. Phenylalanine derivatives of the miniproteins were more capable of inducing a CCR5-binding conformation of gp120. Stricher *et al.* [2008]
- D7324: This Ab was shown not to bind to clade C gp140 (97CN54). Sheppard *et al.* [2007b] (**variant cross-recognition or cross-neutralization**)
- D7324: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an alternative to using bone marrow for generating libraries. D7324 was among a set of Abs used for competition studies to define the binding sites of the newly isolated MAbs, representing a MAb with a C5 epitope. Koefoed *et al.* [2005] (**antibody binding site definition and exposure**)
- D7324: The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels of CD4 for infection, and increased sensitivity to neutralization by sCD4 and 17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1 Bori and microglia-adapted HIV-1 Bori-15 was assessed in ELISA binding assays using F105, IgG1b12, 17b and 48d, 2G12 and 447-52D. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. The kinetics of D7324 binding were tested as a control, and were unchanged. Martín-García *et al.* [2005] (**antibody binding site definition and exposure**)
- D7324: A set of oligomeric envelope proteins were made from six primary isolates for potenial use as vaccine antigens: 92/UG/037 (clade A), HAN2/2 (clade B), 92/BR25/025 (clade C), 92/UG/021 (clade D), 93/BR/029 (clade F) and MVP5180 (clade O). This was one of a panel of MAbs used to explore folding and exposure of well characterized epitopes. The clade C isolate BR25 is apparently misfolded, as conformation-dependent antibodies did not bind to it. D7324 bound to clade A, B, C, D and F HIV-1 primary isolates, but not to the group O protein. Polyclonal sera raised in rabbits against these antigens cross-bound the other antigens, but none of the sera had neutralizing activity. Jeffs *et al.* [2004] (**vaccine antigen design**, **subtype comparisons**)
- D7324: Used to capture gp120 onto solid phase for epitope mapping. Basmaciogullari *et al.* [2002]; Binley *et al.* [1998]; Ditzel *et al.* [1997]; Herrera *et al.* [2003]; Moore *et al.* [1993a,b]; Poignard *et al.* [2003]; Sanders *et al.* [2002]; Xiang *et al.* [2002a]
- D7324: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a C5-binding polyclonal Ab that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- D7324: Called NEA9205 – gp120 capture ELISAs with MAbs D7324 (anti-C-term) or 9205 (anti-V3) were compared in a study of orientation of glycosylation sites – CD4 binding could only inhibit deglycosylation when gp120 was bound to the plate by D7324, not by 9205, while Abs from HIV-1 in-

B Cell

fected people inhibited deglycosylation most effectively when gp120 was caught by 9205. Gram *et al.* [2002]

- D7324: Epitope in C5 – Does not neutralize JR-FL nor block gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- D7324: Binds to the last 15 amino acids in gp120 – used for antigen capture ELISA. Wyatt *et al.* [1995]
- D7324: Binding unaltered by gp120 binding to sCD4, in contrast to 110.5, 9284, 50-69 and 98-6. Sattentau & Moore [1991]

- 1027/30D: A significantly higher level of anti-V3 Abs (694/98D) and anti-C1 mAb (EH21) bound to gp120 complexed with 1027/30D mAb than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of 1027/30D to gp120 increases exposure of specific V3 and C1 mAb epitopes. Visciano *et al.* [2008b]
- 1027: A mouse CD4 T cell clone proliferated well in response to gp120 alone but this response was inhibited by more than 80% when gp120 was complexed with mAb 1027. These results indicate that anti-CD4bs Abs inhibit CD4 T cell responses to gp120 in the murine system. Visciano *et al.* [2008a]
- 1027-30D: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 1027-30-D: Called 1027-30D. scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 1027-30-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – anti-CD4 binding site MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – CD4BS MAbs 654-D, 559/64-D, 588-D, 830-D, 1027-30-D, and 1202-30D strongly diminished proliferation. - 1125H: This Ab was used to screen a phage peptide library but no positive clones were observed. Wilkinson *et al.* [2007] (**antibody generation**)
- 1125H: This Ab bound with an intermediate affinity to gp120IIIb, it did not prevent uptake of gp120 by APCs, and it had a weak inhibitory effect on gp120 antigen presentation by MHC class II. 1125H readily disassociated from gp120 at acidic pH. Lysosomal enzyme digestion of gp120 treated with 1125H yielded fragmentation similar to that of gp120 alone, and digestion rate was intermediate, between the rapid digestion of gp120 alone and the slow digestion of gp120 in complex with high-affinity Ab5145A. It is thus concluded that CD4bs Ab 1125H does not have a strong inhibitory effect on gp120 processing and presentation. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)
- 1125H: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 1125H: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three anti-CD4BS MAbs were tested, including IgG1b12 which neutralizes both JRFL and SF162. The affinities for IgG1b12 and 5145A were similar for both JRFL and SF612, but 1125A bound with 2.5 fold higher affinity to SF162. 5145A and 1125H both preferentially neutralize SF162, but not JRFL, and the CD4BS is more sensitive to neutralization in the context of the SF162 V1V2 loop. This was also true for neutralization by sCD4. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 1125H: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – bound and directed lysis against all four strains. Alsmadi & Tilley [1998] (**ADCC**)

- 1125H: Amino acid substitutions in HXB2 that strongly inhibit binding: 88, 102, 117, 113, 257, 368, 370, 421, 427, 457, 470, 480. Thali *et al.* [1992a] (**antibody binding site definition and exposure**)
- 1125H: Precipitation of Delta 297-329 env glycoprotein, with has a deleted V3 loop, is much more efficient that precipitation of wild type. Wyatt *et al.* [1992] (**antibody binding site definition and exposure**)
- 1125H: Binding to gp120 inhibited by CD4 – epitope is destroyed by reduction, but not by removal of N-linked sugars – neutralization of MN, RF, SF-2 and IIIB – neutralization synergy with anti-V3 MAb 4117C. Tilley *et al.* [1991a] (**antibody binding site definition and exposure**, **antibody interactions**, **variant cross-recognition or cross-neutralization**)

No. 1344
MAb ID 120-1B1
HXB2 Location Env
Author Location gp120
Epitope
Neutralizing L
Immunogen
Species (Isotype) human
Ab Type gp120 CD4BS
Research Contact Virus Testing Systems Corp., Houston, TX
References Gorny & Zolla-Pazner 2004; Watkins *et al.* 1993
Keywords antibody binding site definition and exposure, review

- 120-1B1: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 120-1B1: A neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – 120-1B1 was not affected by this mutation. Watkins *et al.* [1993] (**antibody binding site definition and exposure**)

No. 1345
MAb ID 1202-D (1202-30-D)
HXB2 Location Env
Author Location Env
Epitope
Neutralizing
Immunogen
Species (Isotype) human (IgG1κ)
Ab Type gp120 CD4BS
Research Contact Susan Zolla-Pazner (Zollas01@mcrcr6.med.nyu) (NYU Med. Center)
References Gorny & Zolla-Pazner 2004; Nyambi *et al.* 2000; Hioe *et al.* 2000; Nyambi *et al.* 1998
Keywords review, subtype comparisons

- 1202-D: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
